==========

HTF Zone Mechanics:

- MoM zones will cause at least 1 reaction if UM
    - After the first reaction - see how the price action reacts:
        - Does it reverse whiplash instantly? ~ All liquidity drained. | **Pierced ~ BS/Whiplash**
        - Does it have a minor reaction & retest? Does the zone hold?
            - Zone holds **| Long Consolidation ~ Swing Scalps**
            - Zone breaks but price returns **| Short Consolidation ~ SS --> BS/Whiplash**
    - If the price does not pierce or sharply whiplash upon testing the zone, expect a slow consolidation around this POI for 2-4 days.
        - Consolidation will end in price retesting the opposing liquidity and then pierce through the zone until reaching the BoM Liquidity

==========

Whatever profits are floating at the end of the day from open trade - CLOSE THEM. TAKE ALL THE PROFITS!!!

You can re enter tomorrow. If it is REALLY a winning trade, you can re enter.

TAKE YOUR FUCKING PROFITS.

Stop-Limit Orders are <u>literally</u> a BUILT-IN MECHANISM for trade reinforcements.

Field map every trade on DXY.

Where is the entry, where is the TP, where are the liquid pressure zones from beginning to end?

Snipe the entry.

Trap the liquid pressure.

Map out the entire killshot from BEGINNING to END w/ all important checkpoints in between.

The moment the entry fires - the trade should BUILD ITSELF naturally and close full TP - without me needing to manage or monitor anything.

FULL-CYCLE Liquidity Sniping.

Master Levels Unlocked.

London session is literally a field mapping session.

We can scalp a bit to keep the instincts sharp, but the primary purpose of London session is to:

1. Field map liquid pressure zones that will activate during NY
2. Lay precise entries on active liquid pressure zones to build a position for NY.
3. Stop-Limit trap all the passive liquid pressure zones that will wake up during NY.
4. Map the **End of NY Session TP** point to ENSURE profits are taken BEFORE the market closes.

NY session is where majority of profits are made.

Not because of anything we do during NY session - **but based on how we we set up the trade during London session.**

DXY wakes up during NY session.

London has intra-session trading opportunities as well - price does move during London session, but the biggest money will be made DURING NY session based on the decision made during London session.

London sets up NY for success.

Decisions made in London play out in NY.

Wake up early in the morning.

- Map the lightning for the day before London session even opens.
- 5m scalp all the free money during London session open
- Get paper profits + visual drills done before lunch

After I break for Lunch + gym - all of the heavy lifting for the day is literally done.

I can just relax, passively trade, and focus on other things.

The trades will take care of themselves without any intervention or supervision needed from me.

- Morning Mapping already setup the entire trade w/ reinforcements + EOD TP target to DXY precision.
    - ELITE Liquidity Sniping Field Map.
- London Scalps already banked profits for the day.
- After NY session moves I can put all SLs into BE and just let the trades run.
- HANDS FREE NY session.
    - Trades will hit TP and close themselves.
    - Intentional spread ensures we do not overshoot TP target

<u>Stop-Limit Order Mechanics - (REINFORCEMENT ROCKETS):</u>

- **<u>Trigger zones should be 2-3 zones in front of entry zone.</u>**
    - At least one FULL zone buffer between trigger + entry zone.
    - **Thin liquidity zones are NEVER allowed to be entry zones or stop loss zones.**
        - If there are 2 thin zones in front of the entry zone - make the 3rd zone the trigger zone.
- **<u>Trigger Price:</u>**
    - **Make sure the stop price is 1-2 pips INSIDE the target liquidity zone. NOT on the edge.**
        - This prevents false sweeps from triggering the limit order.
    - **For Rocket #1:**
        - Trigger price is 1-2 pips inside the **<u>close edge</u>** of the trigger zone
    - **For Rocket #2/3:**
        - Trigger price is 1-2 pips inside the **<u>far edge</u>** of the trigger zone

SL should be <u>1-2 pips OUTSIDE THE BACK EDGE OF THE STOP-LOSS ZONE!!!</u>

- **<u>If thin liquidity zone - move it 1 pip inside the next zone. Extra buffer.</u>**
- **If NY session trades - 2-3 pips | London session 1-2 pips**
- If there is not this much distance - the rockets will likely blow up in your face.
- One zone back from the reinforcement
- **<u>Triple anchor Reinforcements</u>**
    - **Stop zone target**
    - **Entry zone**
    - **Stop Loss Zone**
- **Use the Fibonacci Tool to map the reinforcement points.**

FIBONACCI REINFOCREMENT ROCKETS:

- Align the reinforcement trade setups to
    - .382
        - .382 - 0.5 (initial strong reaction)
    - .618
        - 0.5 - .618
        - .618 - .786 (strong pressure zone)
    - .786
        - .786 - 1 (final blast)
- Map the nearest swing high/low **on the 15m**
    - **Initial Fib Mapping:**
        - Use the support/resistance level of your entry zone as the "bottom" of the fib tool and the nearest relevant swing high/low as the "top"
            - Sell move example:
                - Support level of entry for bearish breakout surge = bottom
                - Nearest swing high prior to consolidation = top
                - Fibonacci Map = down
            - Buy move example:
                - Resistance level of entry for bullish breakout surge = bottom
                - Nearest swing low prior to consolidation = top
                - Fibonacci Map = up
    - Locate the 1.382 - 1.786 level
        - **This is the cleanest entry for a reinforcement rocket. The exact lines Fib should line up with 90% accuracy to the actual entry.**
    - The trigger zone should be around the 2.382 - 2.786 level

ENTRY CRITERIA

1. Front edge/middle of the zone
2. Back edge of the zone
3. Front edge of the SL zone
4. Middle/back edge of SL zone (if thin liquidity with extended SL)

MAXIMUM 3 ROCKETS PER TRADE.

(Recommended limit = 2)

PROFIT TAKING LAW:

I will close ALL open trades by NY market close and take profits.

The only exception is trades I OPEN at NY market end for Tokyo/London price action.

WE DO NOT LET TRADES RUN OVERNIGHT THAT WERE SETUP DURING LONDON SESSION.

ALL LONDON MAPPED TRADES ARE CLOSED BY END OF NY SESSION.

Take profits.

If the trade analysis is strong, we can re enter during Tokyo and catch the rest of the wave.

Stop limit order ENTRIES should target the float outside of the liquidity zone.
SL inside the next zone always.

High ROI Cashflow Pairs:

- EURUSD
    - HTF + LTF moves
    - Medium paced
    - HTF consolidation = Swing Scalps
    - HTF breakout = BS/WL
- GBPUSD
    - Great for LTF moves
        - Swing Scalp friendly
    - **LIQUIDITY** is the only thing respected.
        - **Expect S/D to get pierced & price absorbs nearest liquidity before moving.**
        - Found a S/D POI? Expect the nearest liquidity zone to be the first reaction point
            - Liquidity above the demand zone. Look for bullish liquidity.
            - Liquidity beneath the supply zone. Look for bearish liquidity.

- NZDUSD
    - HTF + LTF moves
    - SLOW paced
    - Swing scalps exist, but are slower moving and on the 15m chart.
    - Can be messy. Avoid live markets without backtesting
- AUDUSD
    - HTF moves only
    - Find the trend on the $H/D - map the liquidity ladder, just catch reinforcements and surf
    - Molasses. Expect 2-4 days before HTF move completes.
    - Load up reinforcements and surf.
    - Trade like breakout surge but slower and with more entries on liquidity zones.

Chart all liquidity zones on the 5m and 15m timeframe. They are EXTREMELY accurate.

Scalping Rules:

- **SL must be 1.5-2.5 pips inside the next 5m liquidity zone. No exceptions.**
    - Don't skimp on safety just because it is scalping. Be extra cautious.
    - Maximize RRR with 3-4 entries. Net RR can easily be 5x
- Target 5m storyline specific S/D zones.
- Anticipate the next move. What is price going to do after it hits TP? Understand the mechanics deeply enough to see what is coming.
    - Snipe the liquidity. Place traps.

When you see big fat solid candles in real time that look like it's about to breakout - wait. It might just be a wick ;)

Log paper profits around 7-8pm after dinner.

Paper profits need to be logged IN THE EVENING by EOD.

Do not leave it for morning.

Multi-Chart Trading Rules:

- We are allowed to look at multiple charts to identify trading opportunities - **but can only trade one chart at a time.**
- 10% risk allocated per trade setup. Choose ONE chart to execute this trade setup.
    - Choose whichever chart is giving the highest RRR and the cleanest entry

Entry Flow:

- Map 4H & 1H storyline
    - Place limit orders for NY session swings.
- Map 15m storyline around current price action
    - Scalp this for first 3-4 hours of London session

It is MANDATORY that we go outside around 2pm-5pm

1. I only recharge from MOTION. Need to DO things with my physical body.
2. Scalping is done by this time and price action is going to be slow until NY open.

Trade the 4H Storyline. Nothing else is relevant.

- 5m/15m are only for liquidity charting + entries.
- London Session Scalping is literally ONE 4H candle.
    - All trade biases for London session scalping should align with the micro-storyline of 4H price action

Daily Start-Of-Day Charting Habits:

- Clear charts and draw all the zones FRESH. On EVERY pair.
- Map the 4H storyline w/ 15m liquidity first.
    - Map out the swing trades for NY session
    - Map out the predicted price action for London + NY session
        - Different colors for NY & London session
        - London session visible on 30m/15m timeframe and NY visible on 1H/4H
        - London is mapped to 15m storyline
        - NY mapped to 4H storyline
- Scale down to 15m storyline - map the London Session Scalping opportunities
    - 5m liquidity for 15m storyline
- CLEARLY LABEL **with different colors:**
    - What is the storyline for 4H & 15m
    - What are the trade setups for NY session ~ aligned with 4H storyline
    - What are the trade setups for London session ~ aligned with 15m storyline
    - **Label with words and text on the chart**
        - Can adjust visibility so it's mapped to their respective timeframes and reduce pollution

Highkey - GU + AU > EU

MUCH higher RRR.

GU can be messier and have wick outs. Be cautious. EU & AU align on mechanics. AU is even cleaner than EU and can be scalped during London session.

I should chart:

- **AUDUSD FIRST - look for scalps here**
    - There are probably some CLEAR and SOLID scalps from liquidity --> S/D
    - Chart the moves for the day. London scalps + NY swings
- **GBPUSD 2nd - look for scalps here**
    - Chart the moves for the day. London scalps + NY swings
- **EURUSD 3rd - look for NY swings here.**
    - Can scalp if good opps are there & AU + GU BOTH have no good opportunities.

Drill 5m London Session Scalping until we have a scalping framework as robust as the Swing Trading System.

STOP closing trades that are "about to hit stop loss" while they are in the red!

You think you are "managing risk" when what you're really doing is ACTUALIZING the risk. Risk management is already engineered into the trading system.

LET IT HIT STOP LOSS!!!

Most of the time when we close trades "before they hit stop loss" - they end up reversing and moving into profit.

Drills are THE MOST IMPORTANT THING and what we should spend MOST OF THE DAY doing.

Live markets do not need to be monitored constantly.

We should spend maybe 30-40 minutes drawing fresh charts on each pair, doing the analysis, and setting up any entries.

- Trades should be OBVIOUS and CLEARLY VISIBLE. It really should not take more than 3-5 minutes to SEE and start setting up a trade.
- We can spend 5-10 minutes refining the charts/analysis/trade setup after it's and mapped - but it shouldn't take more than 20-25 minutes to fully setup all trades for London session.
    - And 15-20 minutes to chart all the zones from 4H --> 5m

Total time on live charts during London session open should be MAX 1 hour.

After the trades have been setup in MetaTrader and charts for the day have been written - **SWITCH TO TRADEZELLA & DRILL LONDON SESSION SCALPING!!!**

We should literally RINSE TradeZella as much as possible. 4 drills a day. 2 in the morning and 2 after the gym.

Live markets will take care of themselves. The trading system we are using to setup trades is engineered to produce self-managed trades. Autonomous trade executions. Set it and forget it.

There should only be 2 real moves we catch in London session. They should both be visible from the charts before London session opens.

Just set the limit orders, follow the entry checklist, check for rookie mistakes, and then forget about it. Throw the phone on the couch and shift to tradezella.

You don't need to do anything to manage the trades they will take care of themselves.

You can check on them before going to the gym after 3 hours of market activity.

That will have been enough time to move at least ONE trade. The other will move while in the gym.

Any other trade setups possible during London session will be visible by this time. Can set them up before leaving for the gym in around 15-20 minutes.

So day structure is as follows:

9am - EU/DXY swing trading drills (warm up brain)

10am - chart live markets FRESH on each pair for the day. Check for blind spots on 5m.

10:30am - setup trades for NY session swings + London session scalps. Include reinforcement rockets for NY session moves.

11am - throw phone onto couch, put live charts in a separate window - laser in on tradezella drills + trading notes for 3 hours

2pm - break for gym. Check live markets and review LSS. Setup/manage any LSS trades you see fit

5pm - post-gym relax. Eat. Check live markets. Close out LSS trades. See if any adjustments need to be made to NY trades

6pm - tradezella drills

7:30pm - relax. Let NY swings run. Move into BE if in the green

100pm sleep

London Session Scalping structure:

- Live markets - 1 hour
- Tradezella drills - 2 hours
- Trading notes review - 1 hour
- Gym - 2 hours

Live trades manage themselves.

2-3 hour gap between check ins

The feeling of "I need to catch trades and get more practice" COMES FROM DRILLING ON TRADEZELLA - not live markets.

Tradezella = Mad Scientist Laboratory

London Session Scalping Rules:

1. You MUST chart EVERY 5m liquidity zone. No exceptions.
2. Use the 4H storyline to inform the 15m storyline.
3. 5m/15m S/D zones are wonderful TP points
4. Use The Ladder Method
    1. Liquidity ladders.
    2. Reinforce on each step up the ladder
    3. Leave one "step" from the entry as a buffer zone before reinforcing.
    4. Leave reinforcement rockets on the next 3 steps up the ladder.
        1. Use Stop-Limit Order Mechanics to setup these trades correctly
5. After you have setup your trades - DO NOT LOOK AT LIVE CHARTS FOR THE NEXT 3 HOURS
6. Drill LSS in Tradezella until it is time for the gym.
7. 20min live market check allowed after 2pm.
    1. Make any adjustments you want - then leave it again until 5pm
    2. 5pm pre-NY prep is the 2nd 20min checkpoint on live markets.
        1. At this point either take your profits or choose to let it run
        2. **No more setting up trades by 5pm. Now we are just taking profits.**

<u>If you stop loss ends up sitting inside a liquidity zone - you MUST move it 2 pips outside the back edge of this zone.</u>

<u>No exceptions.</u>

As a rule - we DON'T want to reinforce *thin liquidity* zones.

We DO want to reinforce **THICK LIQUIDITY ZONES.**

They are much more likely to hold their position and provide real fuel.

<u>TIME ANCHORS FOR LIVE MARKETS:</u>

- 10am - setup trades for the day
- 1pm - quick London session check-in
- 5pm - quick intraday check-in
- 6:30pm - quick NY session check-in
- 10pm - final NY session check-in
    - Decide whether to TAKE YOUR RIGHTFULLY EARNED PROFITS RIGHT NOW - or put SL in **<u>reasonable profit</u>** and let it run overnight.

YOU ARE <u>NOT ALLOWED</u> TO LOOK AT LIVE MARKETS OUTSIDE THESE <u>DESIGNATED TIME ANCHORS</u> OR YOU WILL LOSE PROFITS.

Fill the rest of the day with Tradezella.

Always look at the 1H storyline before setting up trades.

<u>Make it a rule that you do not setup trades on live market without having spent 1 full hour doing visual drills on tradezella.</u>

<u>This is the BEST thing one could ever do for risk management.</u>

<u>If you are late to the market open - you are late. Just enter later.</u>

<u>Do not trade live markets without warming up the eyes and brain.</u>

<u>Even if you "feel sharp" - follow the system.</u>

Rockets are only allowed to be installed on ONE pair at a time.

We can have entries on multiple pairs that are just set-it-and-forget-it low risk high reward setups.

Conscious attention must be allocated to manage rocket-enhanced trade setups.

Even if there are entries on 3 or 4 pairs - no Conscious RAM is needed for 4H storyline snipes to play out.
It is textbook win or lose. Manages itself.

FLR targets require Conscious RAM. So limited to ONE per trading day. ONE pair only.

After $1,000,000 of live profits have been caught we can potentially reconsider.

When mapping **FLR** - the FIRST point of contact with Fibonacci levels **must be mapped as a Fibonacci Rocket w/ 2 thick or 3 thin liquidity zone buffers.**

Subsequent points of contact with the same fib level can be mapped as Liquidity rockets with only 1 thick or 2-3 thin zone buffers.

If a Key 1-2 Fibonacci level is UNMITIGATED - the rockets must be setup as FR.
After the Fib level has been mitigated by an FR setup - then it can be setup as LR.

FLR - When I am using extended Fibonacci Zones (1-2 levels) to forward map Liquidity Rockets for the HTF storyline on the 30m chart. **Fibonacci Vision highlights highest probability LR setups.**

- In FLR I am using **30m Fibonacci Levels as Trigger points** and **Liquidity Zones as entry SL points.**
    - **Liquidity zones are fundamental anchor points for trade setups.**

FR - When I am using the 15m storyline to map localized Fib levels on the 15m chart for LSS or 5m Swing Scalps.

- In FR I am using **15m Fibonacci Levels as Trigger, Entry, and Stop Loss Points.**
    - Liquidity zones provide confluence and precision for trade execution.
    - **Key Horizontal Lines are valid anchor points for trade execution.**
        - Count as a “thin zone” for trade setups

LR - Standard reinforcement rockets based on price action mechanics. Simple & obvious.
Built-in 20-30% failure rate.

If there are thin zones sitting inside a 4H liquidity pool - <u>each thin zone counts as "2 thin zones" for Liquidity Rockets.</u>

Trade Execution = "set it and forget it"

Trade Setup = "use it or lose it"

Trading Ability = "maintain ~ avoid pain"

The life force of Trading Ability is consistency.
Dedicated Daily Exposure.
Making it a habit.
No "on and off" until 10B profits caught and vaulted in Swiss Bullion.

The move that I see on the 4H chart - <u>expect it to take twice as long as I think it will.</u>

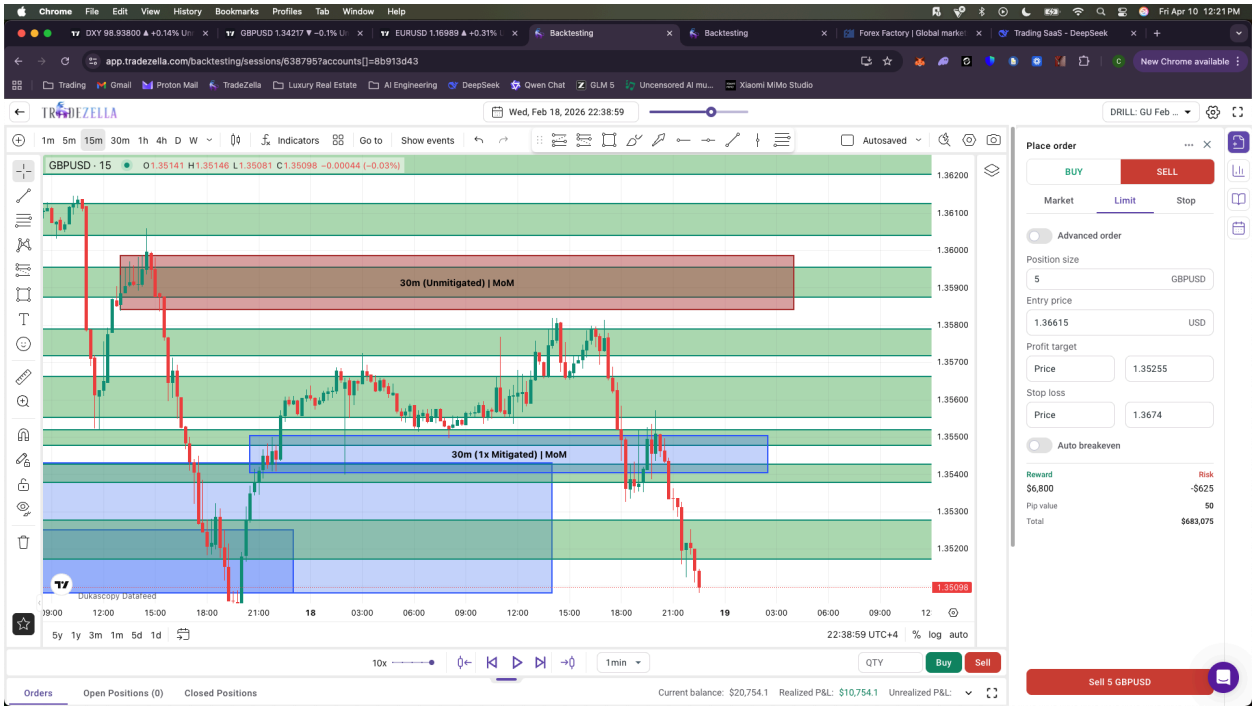

<u>"Today's move" often ends up being TOMORROW's move.</u>

TODAY'S move is the journey TO what I thought "today's move" will be.

<u>Assume it moves at 30-50% of the speed you think it will. Trade accordingly.</u>

Remember that on GU price can often react from the "Liquidity Shield" of a S/D zone (the liquidity zone right in front of a S/D zone)
EURUSD is where PA often directly touches the overlap point.
GBPUSD can use liquidity shields to protect UM zones while still exerting pressure.

<u>Remember this.</u>

Make it a habit to map the macro-shapes on 30m BEFORE setting up any trade executions.

Do not take reversal entries on MoM zones. EVER. Guaranteed loss.

MoM zones are ONLY to be used as LADDER STEPS for trend-aligned trades that surf existing momentum.
This is the ONLY use case.

LOSING A TRADE DOES NOT MEAN YOU SUCK AT TRADING.

IT MEANS YOU MADE A MISTAKE.

FIX THE MISTAKE AND GET YOUR MONEY.
