3D Trade Execution:

1. Map the Path
2. Plant Strategic Rocket Fuel
3. Choose which cannons to fire from

Linear trade setups (Entry/SL/TP) are 1D

Engineering Liquidity Reinforcements into the Linear Trade Setup helps transition smoothly from 1D --> 2D

Adding multiple charts (anchored to DXY master chart) to execute the trade from helps transition smoothly from 2D --> 3D

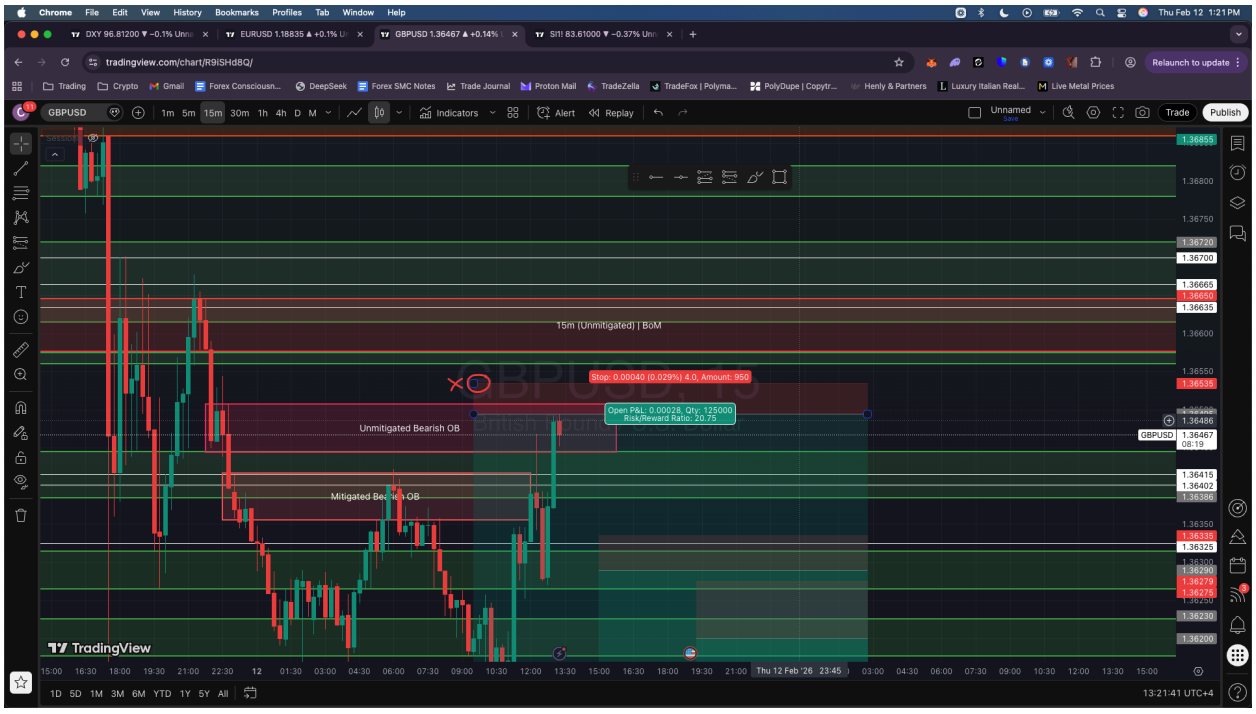

We do not want to have a stop loss “float” in the middle of empty space.

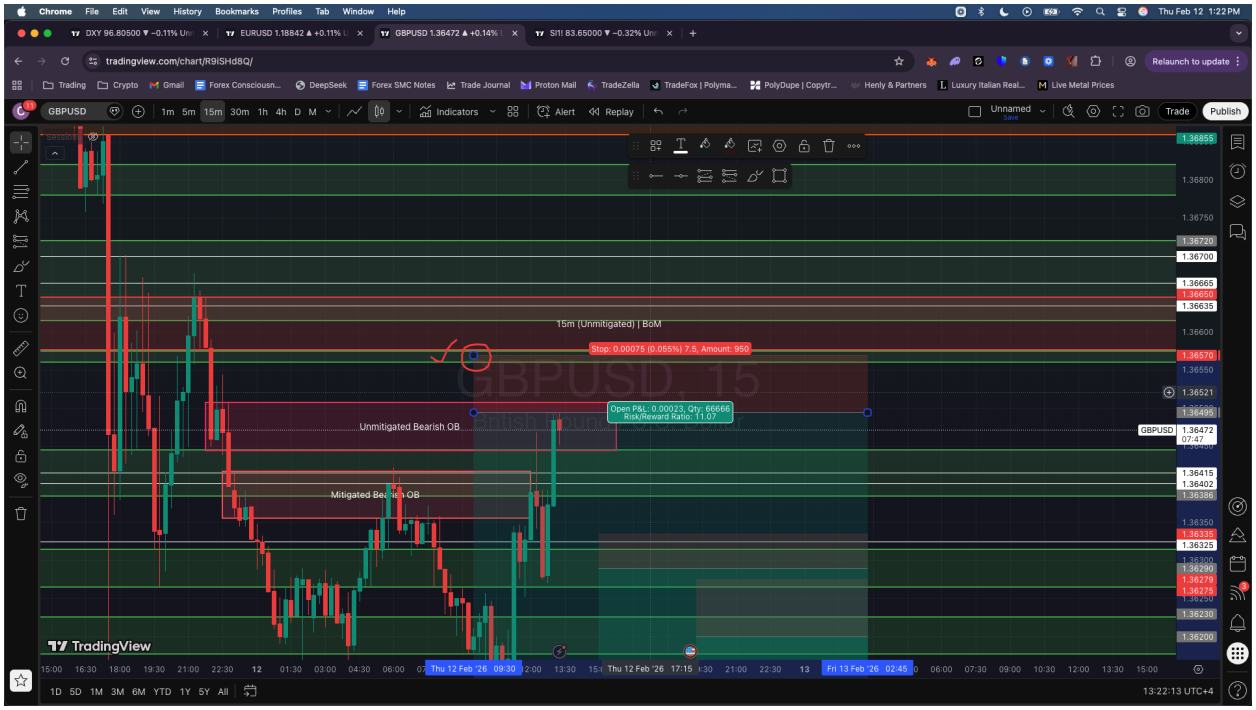

We want the stop loss ANCHORED to a liquid pressure zone.

The liquid pressure is a shield for the stop loss to prevent price from piercing through.

Unshielded SLs are vulnerable to being pierced.

Always keep SLs anchored and shielded.

We should really just use GU for scalping the 5m chart during london session. It is messy as fuck on swings.

EU = primary swing pair.

GU = primary scalp pair

AU = secondary swing pair

NU = secondary scalp pair (edited)

I need to drill **FORWARD MAPPING Trading Shapes** on the chart.

So far I've been letting the price action play and backwards mapping the shapes and combos.

Need to practice backwards mapping the contextual shapes/combos from the previous week that setup this weeks price action.

Then DRAW the shapes that are going to form this week on the chart.

Proceed with the drill as normal.

Do 100+ reps of this until we can ACCURATELY draw/map/predict the exact shapes, to the precise zones, on live charts.

This will help see TODAY's move instead of TOMORROW's move on live markets

Forward map DXY and backwards map GU.

GU has major potential but is not as clean and structured as EU.

Get familiar with its nuances and lets print

BILLIONAIRE WATERFALL CHECKLIST:

- Master DXY price action. Can accurately forward map intraday price action.
- Master EU + GU price action. Both 5m scalps + HTF swings.
- Clear demo profit target without cheating

Micro Skills to Drill:

- 5m chart Scalping
- Stop-Limit Rockets
- GU Swings w/ DXY compass

Data shows that the one week I was actually profitable - I was doing <u>visual drills</u> daily.

- Not live trading drills
- Not backtesting obsessively
- VISUAL DRILLS and nothing else

The recommended KPI is 5 visual drills a day.

This is FAR more valuable than anything else.

We are sniping. We need sharp eyes.

Literally all of the losses we've been taking for the last week are completely unnecessary.

Either we're actualizing risk on trades that don't need to be closed,

Taking dumb losses because we didn't map a 15m liquidity zone or didn't put the SL 1-2 pips INSIDE the zone

Pay attention. Stop the silliness

When we look at the price action - **start seeing the price action as a gigantic hive mind of nano bots working together to engineer the charts.**

The entire market activiety is algorithms and HFT bots. That is where the volume is coming from.

Maybe 100 years ago it was thousands of humans actually trading with each other - now it is computers and AI.

The Leviathan Trading System is a reverse engineering of the price action Master algorithm.

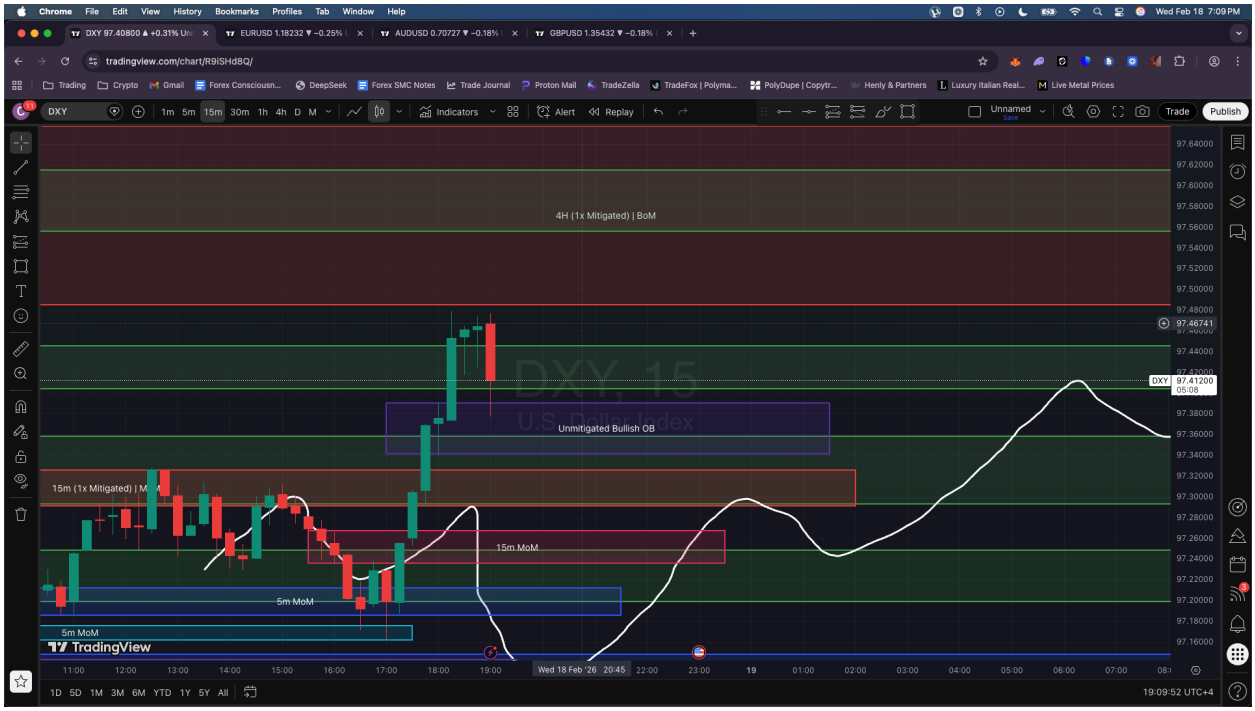

The HFT bots KNOW there is a gigantic 4H liquidity zone right above it.

They intentionally slow down the bullish market activity to keep price right below it until the 1H candle closes.

The market WANTS the 1H candle to close as a solid green candle without any bearish reaction.

The bearish reaction to the 4H zone happens AS SOON as the green 1H candle closes.

The market is aligned with the LTS - I literally built the LTS by studying the market.

4H (1x Mitigated) | BoM
Unmitigated Bullish OB
15m (1x Mitigated) | MoM
15m MoM
5m MoM
5m MoM
