PROFIT TAKING LAW: (Air Element Infrastructure)

I will close ALL open trades by NY market close and take profits.

The only exception is trades I OPEN at NY market end for Tokyo/London price action.

WE DO NOT LET TRADES RUN OVERNIGHT THAT WERE SETUP DURING LONDON SESSION.

ALL LONDON MAPPED TRADES ARE CLOSED BY END OF NY SESSION.

Take profits.

If the trade analysis is strong, we can re enter during Tokyo and catch the rest of the wave.

Whatever profits are floating at the end of the day from open trade - CLOSE THEM. TAKE ALL THE PROFITS!!!

You can re enter tomorrow. If it is REALLY a winning trade, you can re enter.

TAKE YOUR FUCKING PROFITS.

TIME ANCHORS FOR LIVE MARKETS: (Earth Element Infrastructure)

- 10am - setup trades for the day
- 1pm - quick London session check-in
- 5pm - quick intraday check-in
- 6:30pm - quick NY session check-in
- 10pm - final NY session check-in
    - Decide whether to TAKE YOUR RIGHTFULLY EARNED PROFITS RIGHT NOW - or put SL in **reasonable profit** and let it run overnight.

YOU ARE NOT ALLOWED TO LOOK AT LIVE MARKETS OUTSIDE THESE DESIGNATED TIME ANCHORS OR YOU WILL LOSE PROFITS.

Fill the rest of the day with Tradezella.

London Session Scalping Rules: (Water Element Infrastructure)

1. You MUST chart EVERY 5m liquidity zone. No exceptions.
2. Use the 4H storyline to inform the 15m storyline.
3. 5m/15m S/D zones are wonderful TP points
4. Use The Ladder Method
    1. Liquidity ladders.
    2. Reinforce on each step up the ladder
    3. Leave one “step” from the entry as a buffer zone before reinforcing.
    4. Leave reinforcement rockets on the next 3 steps up the ladder.
        1. Use Stop-Limit Order Mechanics to setup these trades correctly
5. After you have setup your trades - DO NOT LOOK AT LIVE CHARTS FOR THE NEXT 3 HOURS
6. Drill LSS in Tradezella until it is time for the gym.
7. 20min live market check allowed after 2pm.
    1. Make any adjustments you want - then leave it again until 5pm
    2. 5pm pre-NY prep is the 2nd 20min checkpoint on live markets.
        1. At this point either take your profits or choose to let it run
        2. **No more setting up trades by 5pm. Now we are just taking profits.**

Stop-Limit Order Mechanics - (REINFORCEMENT ROCKETS): (Earth Element Infrastructure)

- Identify whether environment favors Fibonacci Rockets or Liquidity Rockets
    - **If thin liquidity zone - move it 1 pip inside the next zone. Extra buffer.**
    - **If NY session trades - 2-3 pips | London session 1-2 pips**
        - If there is not this much distance - the rockets will likely blow up in your face.
    - One zone back from the reinforcement
- **Triple anchor Reinforcements**
    - **Stop zone target**
    - **Entry zone**
    - **Stop Loss Zone**
- **Use the Fibonacci Tool to map the reinforcement points.**

FIBONACCI ROCKETS: (Fire Element Precision Attack)

- **Zone Buffers:**
    - **Trigger zones should be 2 Thick Zones or 2-3 Thin Zones in front of entry zone.**
        - At least one FULL zone buffer between trigger + entry zone.
    - **90% of rockets will self-activate if stop is placed 2-3 zones in front of the entry.**
        - **Ladder Method.**

SL should be <u>1-2 pips OUTSIDE THE BACK EDGE OF THE STOP-LOSS ZONE!!!</u>

- **<u>Trigger Price:</u>**
    - **Make sure the stop price is 1.5-3 pips INSIDE the target liquidity zone. NOT on the edge.**
        - This prevents false sweeps from triggering the limit order.
    - **For Rocket #1:**
        - Trigger price is 1-2 pips inside the **<u>close edge</u>** of the trigger zone
    - **For Rocket #2/3:**
        - Trigger price is 1-2 pips inside the **<u>far edge</u>** of the trigger zone
- **<u>Key Levels:</u>**
    - .382
        - .382 - 0.5 (initial strong reaction)
    - .618
        - 0.5 - .618
        - .618 - .786 (strong pressure zone)
    - .786
        - .786 - 1 (final blast)
- **<u>Initial Fib Mapping:</u>**
    - **<u>Map the nearest swing high/low on the 15m</u>**
        - Use the support/resistance level of your entry zone as the “bottom” of the fib tool and the nearest relevant swing high/low as the “top”
            - Sell move example:
                - Support level of entry for bearish breakout surge = bottom
                - Nearest swing high prior to consolidation = top
                - Fibonacci Map = down
            - Buy move example:
                - Resistance level of entry for bullish breakout surge = bottom
                - Nearest swing low prior to consolidation = top
                - Fibonacci Map = up
    - Locate the 1.382 - 1.786 level
        - **This is the cleanest entry for a reinforcement rocket. The exact lines Fib should line up with 90% accuracy to the actual entry.**
    - The trigger zone should be around the 2.382 - 2.786 level

ENTRY CRITERIA

1. Front edge/middle of the zone
2. Back edge of the zone
3. Front edge of the SL zone
4. Middle/back edge of SL zone (if thin liquidity with extended SL)

MAXIMUM 3 ROCKETS PER TRADE.

(Recommended limit = 2)

Fibonacci Rockets Example

LIQUIDITY ROCKETS: (Water Element Precision Attack)

- **ONE ZONE BUFFER**
    - **Trigger zones should be 1 zone in front of entry zone.**
        - **1 Thick Zone OR 2-3 Thin Zones**
        - No entry buffer zone required
- **Mechanics:**
    - Extended Fibonacci Rockets (1-3 levels) are for breakout surge/whiplash moves
    - During swing scalps (LSS prime environment) - the fib is used to map the NY session move and then ignored for any LSS trade setups
    - LSS trade setups are pure S/D/L mechanics. Flow with it.
    - **Expect RRR to be lower than Fib Rockets.**
        - 2-4 RRR is a good range
- **Trigger Price:**
    - Make sure the stop price is 1-2 pips INSIDE the target liquidity zone. NOT on the edge.
        - **If planting back-to-back rockets on a group of zones - stop price can be 0.5 pips inside instead of 1 on subsequent zones**
            - First zone = normal rules
            - Zone 2 onwards = optional relaxed trigger rules
- **SL 1-2 pips outside SL zone's back edge**
- Supply/Demand zones are just TP/entry points.
    - **Trade setup is anchored to liquidity.** (Earth anchor)

Use The Ladder Method. Textbook.

MAXIMUM 3 ROCKETS PER TRADE.

(Recommended limit = 2)

Liquidity Rockets Example

Capital Protection Safeguards: (Earth Element Infrastructure)

Make it a rule that you do not setup trades on live market without having spent 1 full hour doing visual drills on Tradezella.

This is the BEST thing one could ever do for risk management.

If you are late to the market open - you are late. Just enter later.

Do not trade live markets without warming up the eyes and brain.

Even if you “feel sharp” - follow the system.

Mandatory 1 hour of focused Tradezella drilling before opening Mt5 and trading live markets.

Without this you are just gambling.

EFFICIENT LIQUIDITY MAPPING: (Water Element Infrastructure)

- Map the NY Fibonacci Rocket Trade Setup and identify the key 1 and 2 levels.
    - Map the liquidity specifically around these zones
    - Use the 15/30m chart and scroll AS FAR LEFT as you need to find all the liquidity zones around the 1.382 - 1.786 and 2.382 - 2.786 level
        - **Remember this is the cleanest entry for a reinforcement rocket.**
        - **The exact Fib lines should line up with 90% accuracy to the actual entry.**
- **The liquidity outside the 0-1 and key 1/2 levels can mostly be ignored.**
    - We don’t have to map the entire chart - just the surrounding area of the key levels.

Fibonacci Liquidity Rockets: (Earth Element Heavy Attack)

Using the Fibonacci Rocket Setup to map Liquidity Rocket zones.

Engineering both together.
Full trade setup = entry + FR + LR.
Master Trade Setup = E + FLR

Fibo tool powers efficient liquidity mapping.

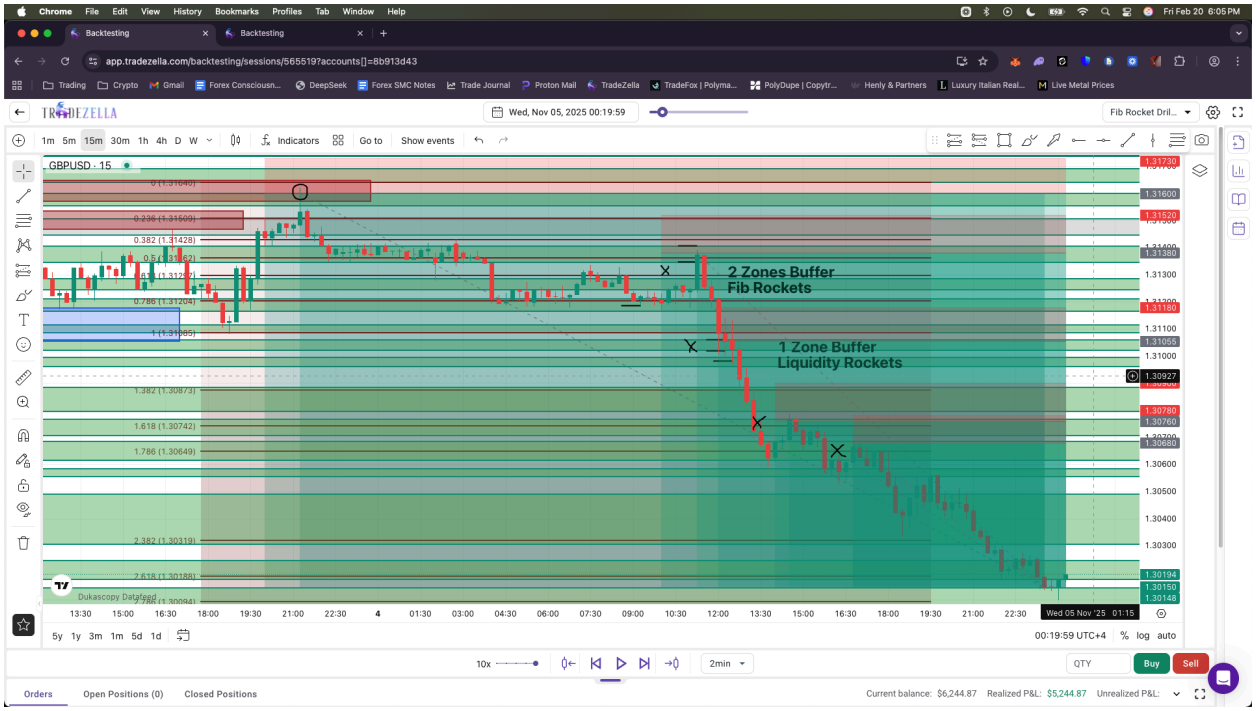

Reduces trade setup latency. Faster execution. Increased hardwired precision.

Fibonacci Rockets + Liquidity Rockets simultaneously.

Up to 7 active rockets possible with hardwired safety + risk management <u>self-managed autonomously.</u>

I only need to decide if I TP at the end of NY session, or move <u>everything</u> into 30-50% profit and let it run overnight.

- If <u>everything</u> cannot be moved <u>30-50%</u> in profit we automatically take all profits before market close. **<u>Mandatory</u>.**

<u>ROCKET STOP LOSSES *ALWAYS* 1 FULL PIP OUTSIDE BACK EDGE OF ZONE!!! NO EXCEPTIONS!!!</u>

<u>ESPECIALLY IF THIN!!!!!</u>

If there are thin zones sitting inside a 4H liquidity pool - <u>each thin zone counts as "2 thin zones" for Liquidity Rockets.</u> (Earth Element Infrastructure)

Remember that on GU price can often react from the “Liquidity Shield” of a S/D zone (the liquidity zone right in front of a S/D zone)
EURUSD is where PA often directly touches the overlap point.
GBPUSD can use liquidity shields to protect UM zones while still exerting pressure.

<u>Remember this.</u>
