If price is consolidating and you're unsure whether it'll break out buy or sell, look at what candles are obviously bigger. This is where the pressure is building.

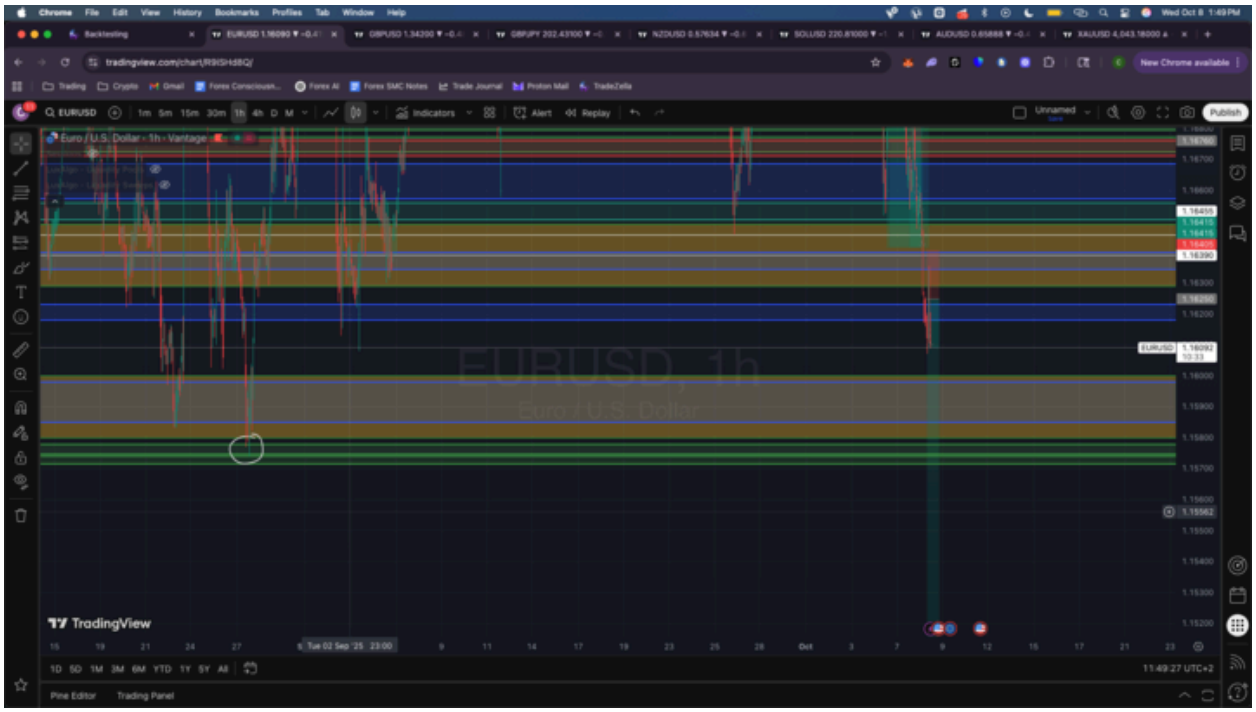

It is visibly obvious that there is more sell pressure than buy pressure here. Hence the breakout for sell

To update the "direction from major zone" idea - we are looking for a CLEAN MOVE from the major zone. NOT a whiplash that leads to consolidation.
WHIPLASHES DO NOT COUNT AS A DIRECTION SIGNAL

Using the Fibonacci Tool - Liquidity zones USUALLY exist between the 0.382 and 0.618 level.
We can use this to project liquidity zones in advance and refine as price action develops.
When mapping a trade, after the fibonacci tool maps TP zones, we can superimpose additional Fibbo tools on top of the trade path to map exactly where the liquidity zones are likely to be.

There will always be AT LEAST 2 retests before a move fully pushes through.
Do not enter on the first retest. If you do - take profits early and re enter on the 2nd retest.
Dont hold through the basic 1-2-3 pattern. Milk it and load up on retest #3

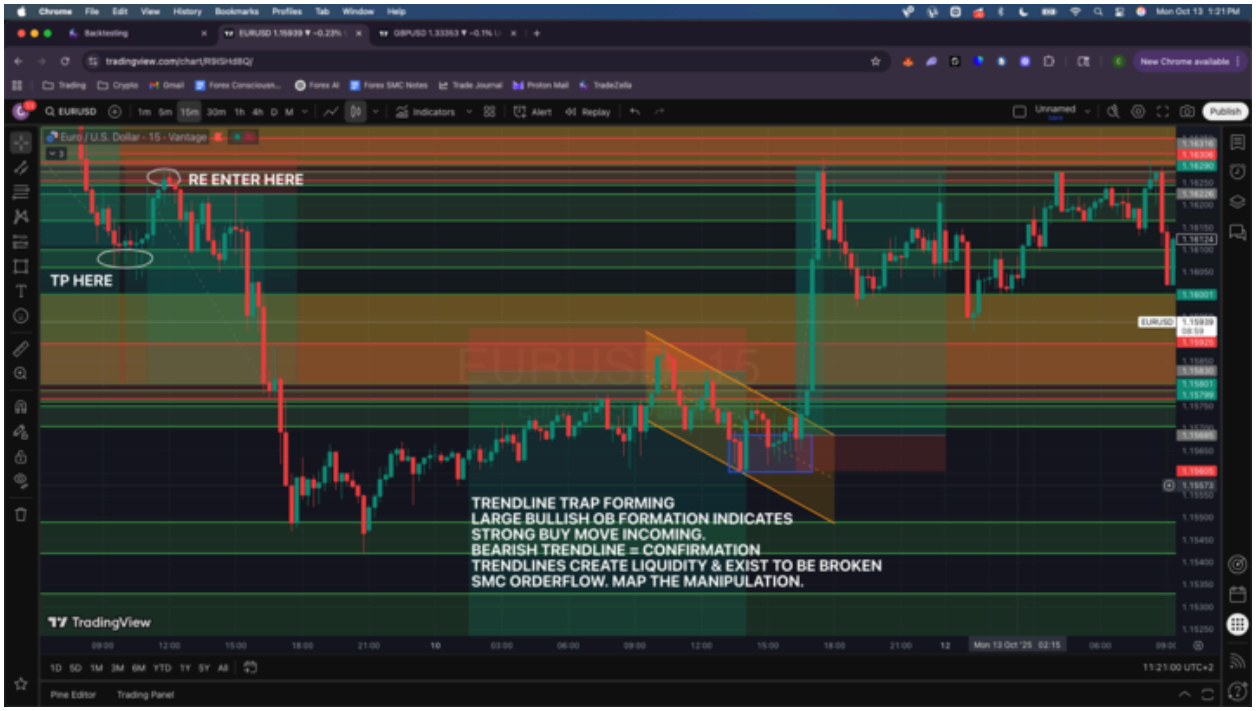

MAKE IT A HABIT to PHYSICALLY DRAW ON THE CHART each retest point and number them so we KNOW where in the pattern price action is and trade accordingly.
The 1-2-3 = scalping opportunity
3 and 4 = swing trading entry

FOMO entries are the #1 source of losses

STUDY THIS. THIS is the KEY to winning 99% of trades

The price action will ALWAYS sweep liquidity zone by zone in a sequential order.
It will NEVER "skip" a liquidity zone.
Always look to see which liquidity zones have been retested & which ones have not.
The zones that have NOT been retested yet WILL be retested.
This is your entry point.
1, 2, 3, 4, 5.
Always one by one.

ALWAYS wait for the "bounce" before entering to know EXACTLY WHERE the price is going to move from.
Identify the pressure zone that will drive the move BY LETTING THE MARKET SHOW YOU. ONLY THEN do we plan entries.

When in doubt always put the stop loss 1-2 pips inside the edge of the next zone

---

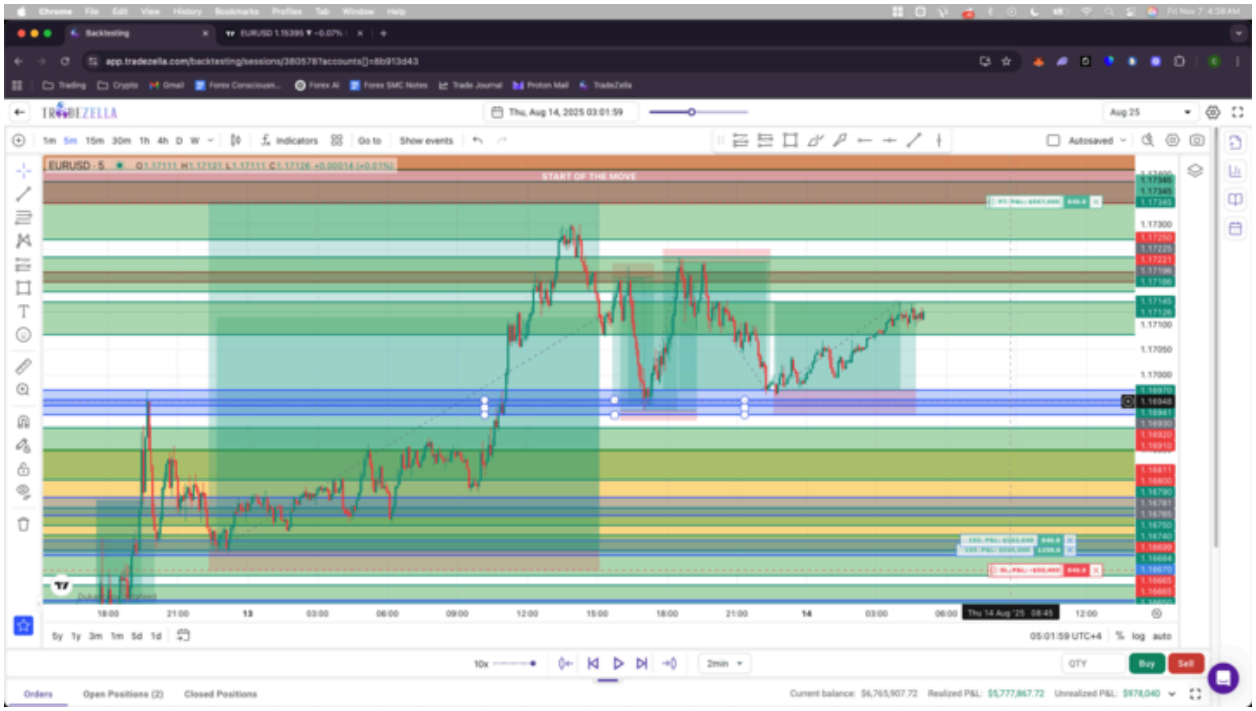

Do not enter for liquidity zone reinforcements until AFTER the 1-2-3 pattern has occurred.
If 1-2-3 has not FULLY happened yet, any reinforcement past the original entry point is EARLY and will most likely get stopped out.
After the 3 has occurred and the FULL MOVE STARTS, THEN liquidity zone reinforcements are valid and will most likely NOT get stopped out.

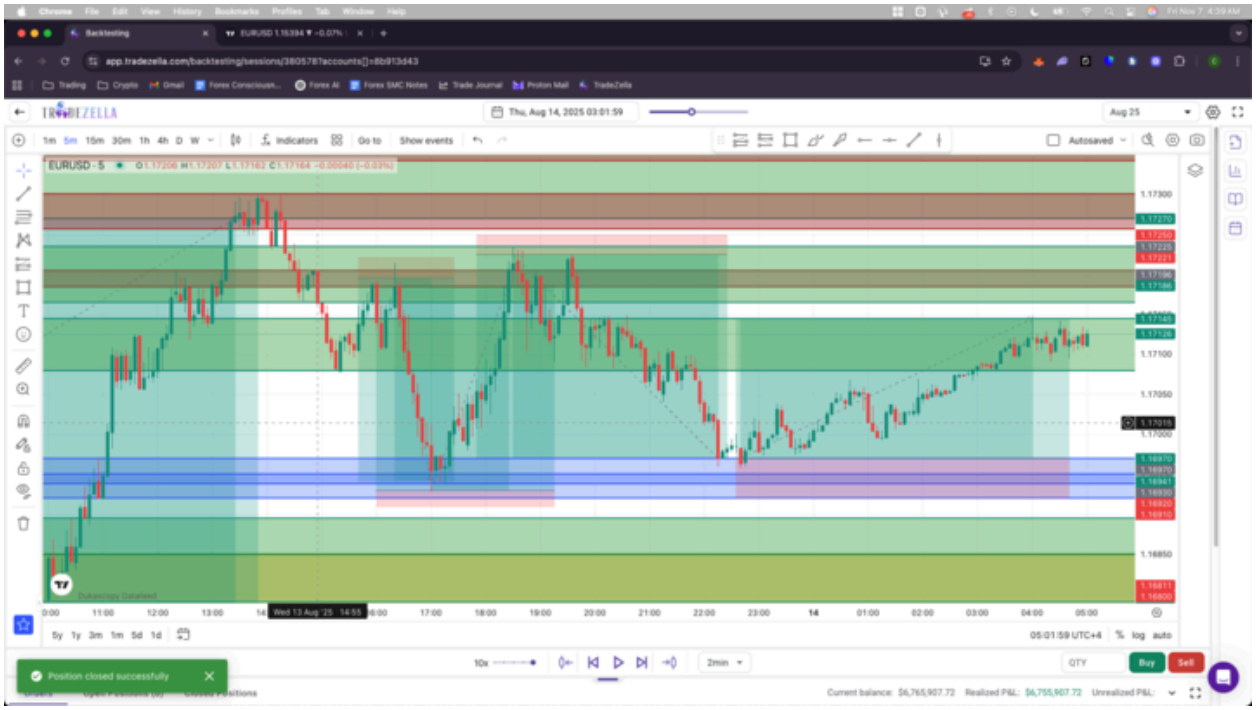

Wicks show direction of pressure.
Upper wicks = buying pressure
Lower wicks = selling pressure

We must enter on the LIQUIDITY and only catch THE MOST PRECISE entries.
Liquidity is often BENEATH the demand OB and ABOVE the supply OB.
Practice ONLY catching THE MOST PRECISE trades that often do not fill.
Drill this and replicate on live markets.

Your job as a trader is not to look at the chart and figure out where the entries are.
Your job as a trader is to simply sit and **wait until you notice a pattern in the price action that very clearly and obviously illustrates a good entry.**
If one does not appear, we just keep waiting and that's it.
Once we see a clear pattern in the price action that obviously illustrates a great trade set up then we enter we don't even need to think because it's obvious.

When a swing fails to fully hit TP and "corrects" to sweep liquidity before continuing the move - THIS IS WHEN WE SWITCH TO THE SCALPING SYSTEM AND MILK THE ENTIRE CONSOLIDATION PERIOD!!!!
It will most likely spend the rest of the trading session consolidating to absorb liquidity and continue the move IN THE NEXT TRADING SESSION.
Note: this is when a LARGE swing move has already happened and reversed BEFORE hitting the major key price zone (but still retains market structure of the current move - forms a higher low for buy trend or lower high for sell trend)

Make it a rule to write out the trade analysis BY HAND + the reasons WHY before making any entires in the market.
This will BULLETPROOF stupid entries and missed trades.

You should NOT have any limit orders open right before news hits - because you DO NOT KNOW wtf price is going to do.
It is okay to have open positions w/ SLs in profit, but having limit orders on the chart right before news is just asking to have your capital wiped.

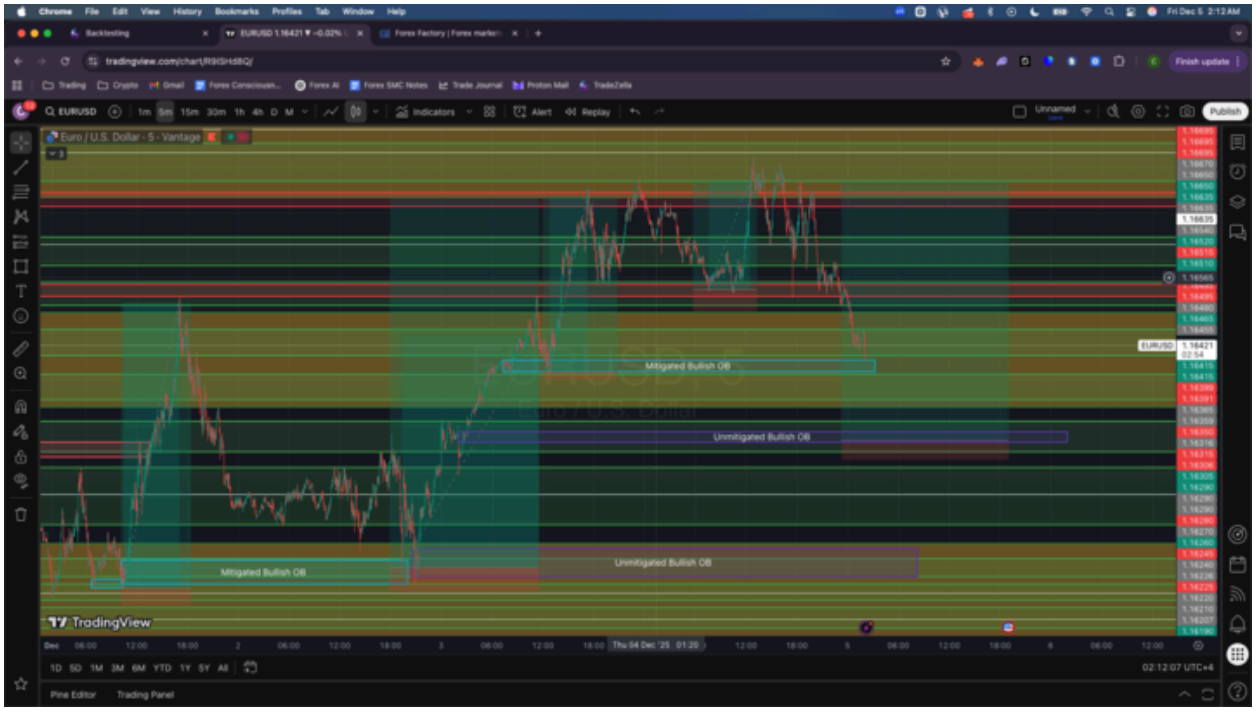

You ALWAYS have to put the stop loss OUTSIDE the liquidity zone. LAW.
If it is inside the liquidity zone - you are literally just being the liquidity.
Only ENTRIES can be inside the liquidity zone.
SLs MUST be outside. At least 1 full pip.
Non negotiable.

The price will usually not reverse until it hits the ORIGINAL S/D zone at the BEGINNING of the move. Especially if there has been a sharp breakout that broke structure on the 1H+ timeframe

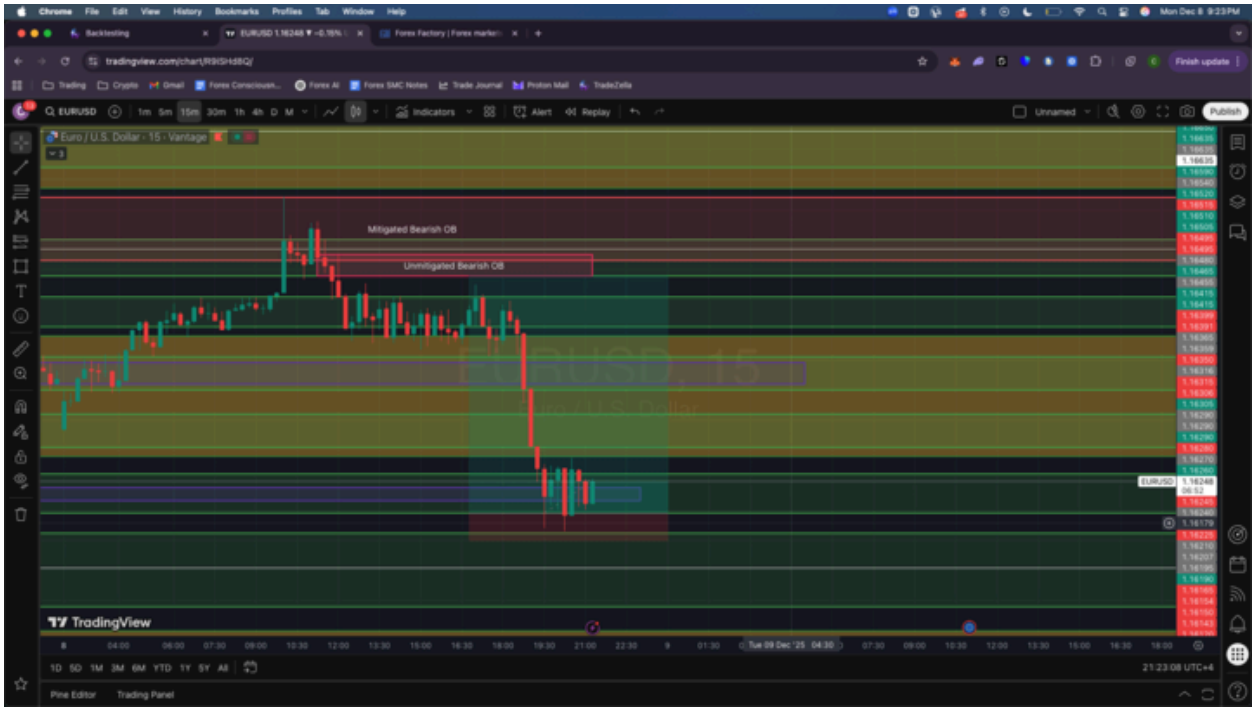

---

The OB that STARTED the move is the one that we enter on. OBs that form halfway through the move are much more likely to be pierced during the retest.
If we missed the initial move - enter in LIQUIDITY ZONES in between. Don't wait for a retest of an OB - enter on the retest of a LIQUIDITY zone and keep same TP.

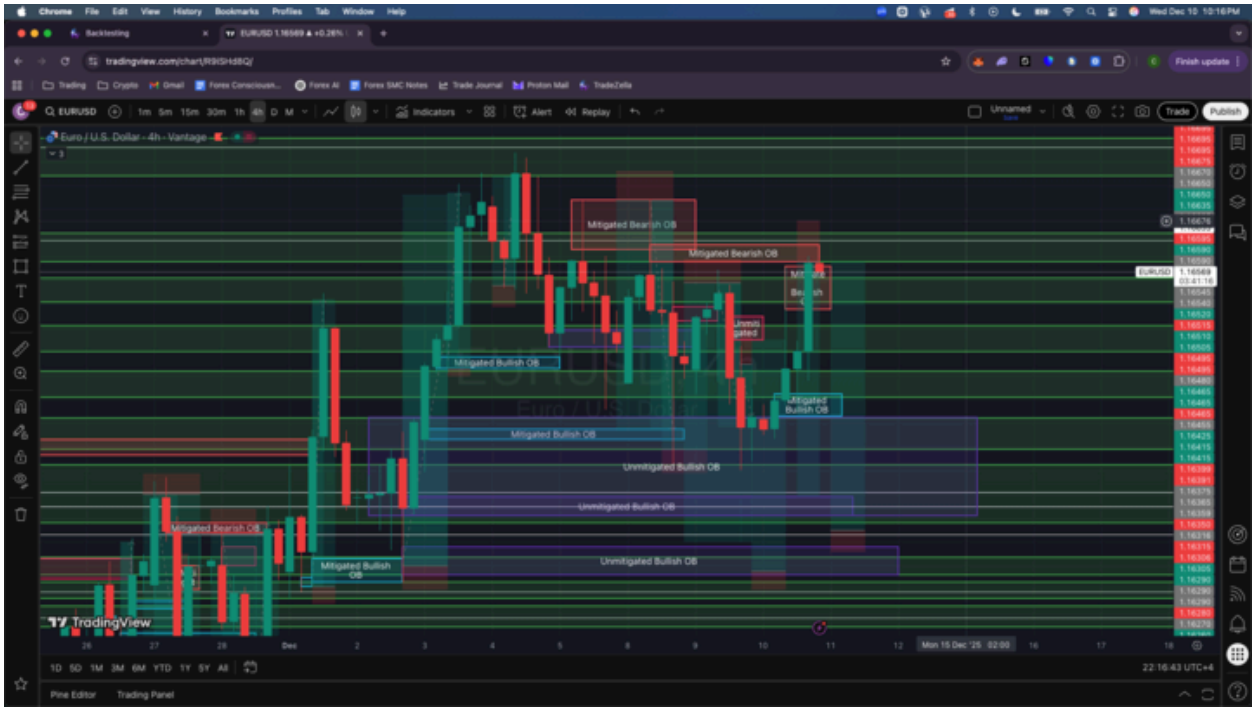

If you literally just caught 1 good trade a day this week trading with the trend, you would have made an average RR of 15x for the week.
JUST by taking the most OBVIOUS and EASY trade setups.
5 trades for the week.
One a day.
Easy simple and obvious. No guessing. Just reading the map, trading with the trend, entering on unmitigated OB/Liquidity overlap zones. Simple.
This is how trading should be done.
Anything MORE is waste and actually costs us profits.
It is designed to be this simple.
Flow accordingly.

When trying to catch a CORRECTION/REVERSAL - ALWAYS make sure SL is 1-2 pips INSIDE THE NEXT ZONE.
This specific instance is when price is likely to pierce the entry zone slightly and breathing room is needed.

Discard key price zones. They are useless. Price is reacting exclusively to SD/Liquidity anyways.
ALWAYS make sure to chart MAJOR 4H ZONES because this is where weekly trends are likely to reverse from even if not visible on 1H or below.

Do not get married to one timeframe. You need to look at EVERYTHING on a MULTI TIMEFRAME analysis.
4H --> 1H --> 30m --> 15m --> 5m
DO NOT SKIP ANY. THEY ARE ALL RELEVANT.
11:33
Map ALL liquidity zones.
SL is ALWAYS 1.5-2 pips inside the NEXT liquidity zone.
PRACTICE TAKING PRECISE SNIPER ENTRIES SO IT DOESN'T FEEL LIKE A SHITTY RRR

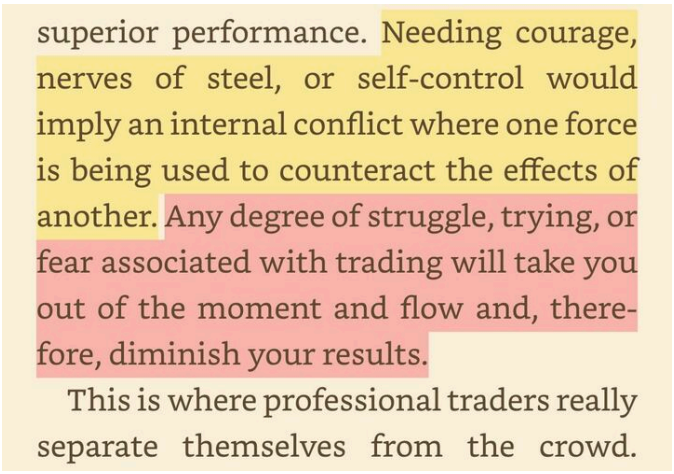

If you are confused about where the trades are - you chart needs to be CLEARER.
LABEL the zones based on timeframe + mitigation level + WHAT PART OF THE MOVE (top, middle, bottom, etc)
Update liquidity zones.
Re-observe charts on multiple timeframes.
STAY SHARP.
Don't get lazy, don't get sloppy, don't get complacent.

Liquidity is Multi-Dimensional.
Apply a psychedelic mindset.
Trade accordingly.
Aether Flow.
Profits manifest themselves naturally.

Get OUT of the “every day is an opportunity to make money” mindset.
This leads to forced trades where there are no opportunities.
Shift into the “Every day is an opportunity to analyze the markets” mindset.
This leads to SEEING CLEAR opportunities for profitable trades and being DETACHED from the timeframe.
Some days there are 0 trading opportunities.
Som days there are 4+
Most days there are 1-2.
We base trading profits on WEEKLY PnL. Not daily.
Treat it like ads. Performance varies in the day to day.
Weekly campaign analysis gives a clear picture.

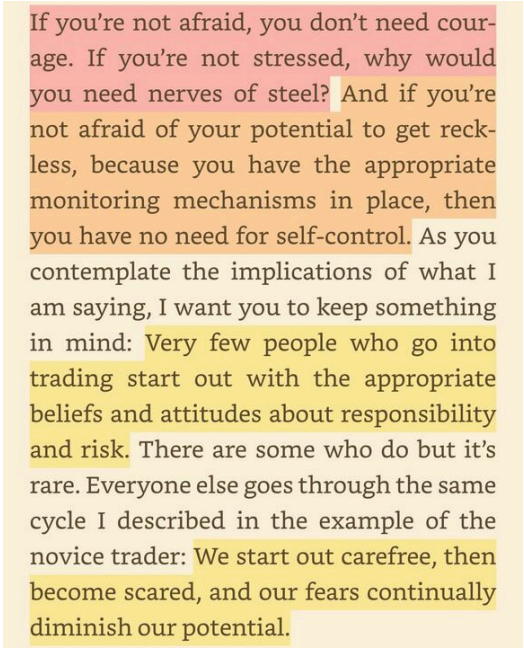

Based on my observations - 4H S/D zones are “one and done”
If they are 100% unmitigated there WILL be a reaction on the first retest, but often it is a minor reaction that is followed up by a strong pierce.
1H zones are still king.
Do not try to catch corrections. This is drastically reducing profit margins.
Simply analyze WHERE is the next key POI that is likely to have a MAJOR reaction and set TP there.
Backtest this to perfection.
Zones that have formed AFTER a period of consolidation are USUALLY stronger than zones that have formed right at the peak of a liquidity sweep.
Stronger zones are more likely to cause a strong reaction.
Weak zones are likely to cause a weak reaction.

The trading system should be built around our natural behaviors.
If I am prone to taking a lot of trades - let's build a trading system that allows me to over trade healthily without blowing the account.
Instead of risking 10% per trade and having a "3 strikes out" policy, risk 3-5% per trade BASED ON FEEL for each individual trade. Maximum 25% drawdown of starting account balance before "cut off" for the day.
All trade setups need to have 3 confluences minimum.
Extremely high conviction trades can increase risk to 10% if truly desired, but the default should be 3-5% as a rule.
This allows for healthy trading without feeling guilty about "over trading" or "taking heavy losses" or "breaking rules"

superior performance. Needing courage, nerves of steel, or self-control would imply an internal conflict where one force is being used to counteract the effects of another. Any degree of struggle, trying, or fear associated with trading will take you out of the moment and flow and, therefore, diminish your results.

This is where professional traders really separate themselves from the crowd.

If you're not afraid, you don't need courage. If you're not stressed, why would you need nerves of steel? And if you're not afraid of your potential to get reckless, because you have the appropriate monitoring mechanisms in place, then you have no need for self-control. As you contemplate the implications of what I am saying, I want you to keep something in mind: Very few people who go into trading start out with the appropriate beliefs and attitudes about responsibility and risk. There are some who do but it's rare. Everyone else goes through the same cycle I described in the example of the novice trader: We start out carefree, then become scared, and our fears continually diminish our potential.

I have noticed it is very easy for me to win trades when I have small capital and very little expectations of "making money now" because I accept it will take multiple days to even get to my trading capital milestone.

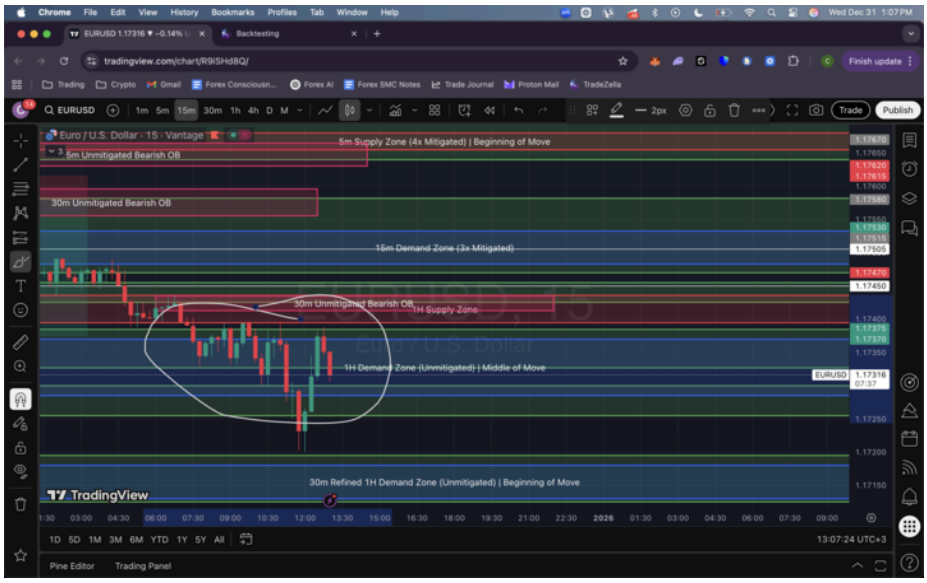

Once I reach this milestone, in my mind it "suddenly becomes real" because I am "2 good trades away from clearing the challenge and getting paid for real" and THIS psychological shift is what causes me to start forcing trades, making mistakes, and taking losses back down to square 1.

If I STAY in the “I will not get paid for at least 2-4 weeks. That is okay. I am not here to make money, I am simply here to analyze the markets and COLLECT any GOOD TRADES that appear. That is it. The goal is to master the game. Period. I am not concerned with how much time that takes. One trade at a time” mindset - I will keep winning even as capital increases.

THAT is the difference between backtest and demo. Backtesting has this mindset through the whole trading session.
Demo I have been think from a “wait this is about to get real” mindset and causing myself to make unnecessary mistakes.
Psycho analysis during trading days is extremely necessary.
We must keep a trading journal to track PSYCHOLOGY diligently.

A 5m supply zone in a sell trend is likely to be stronger than a 30m demand zone <u>because it is a sell trend.</u>
Vice versa applies to buy trends.
Key POIs = trend aligned S/D zone + beginning of move Liquidity.
These^ are great trading opportunities.

“Middle of Move” zones of the opposite direction are likely to get PIERCED even if they are unmitigated. (Demand zones in a sell trend, supply zones in a buy trend)
They will still cause a minor reaction, like a consolidation period or a short upswing, but if it is not “Beginning of the Move” liquidity - it is likely to get pierced and continue the trend.
Keep this in mind when setting TP points.

Pinned

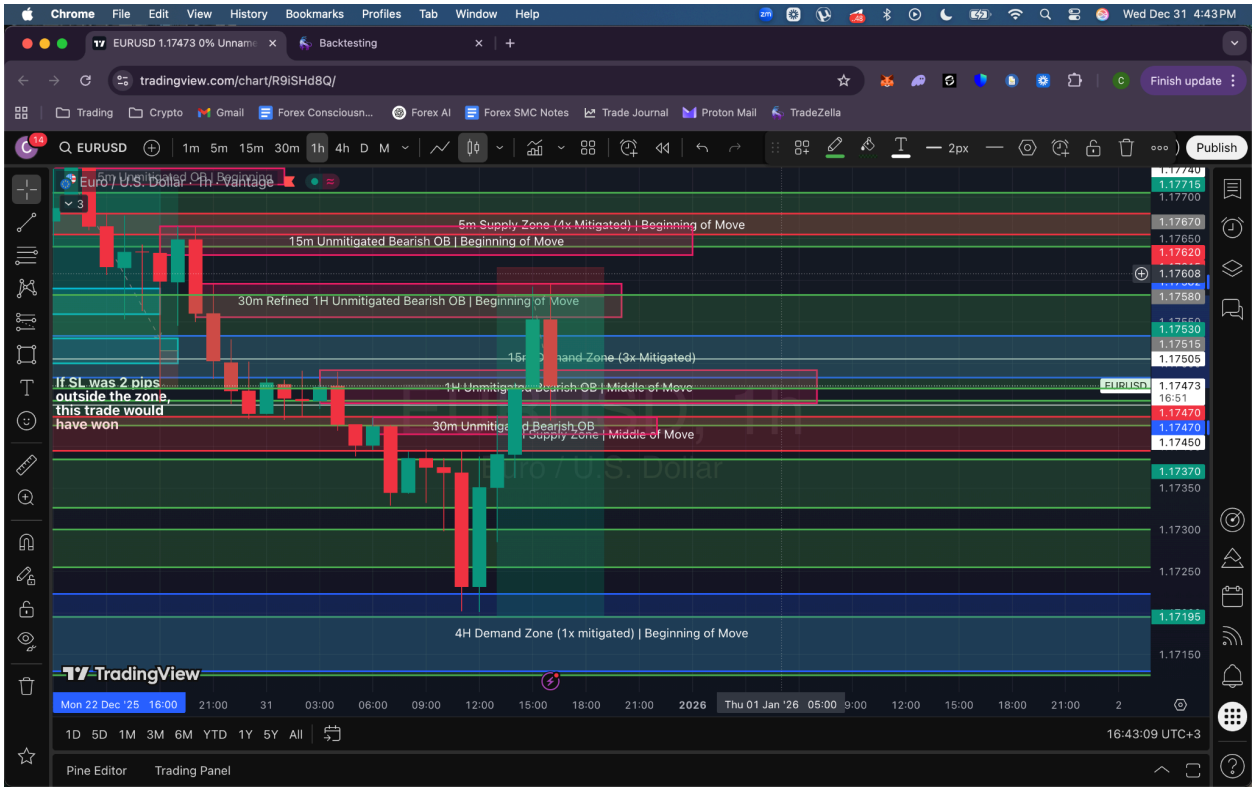

“Middle of Move” zones tend to get pierced the most often. Especially if there is strong liquidity from the opposing side causing a reaction.

Note how even though this is a sell trend, the “middle of move” supply zones were PIERCED by the reaction to the 4H demand zone.

“Middle of Move” zones are good entry points for REINFORCEMENTS of an existing move, but if the reaction to opposing liquidity has already begun, these are death zones for trend continuation trades.

WAIT until the price action reaches a “Beginning of Move” zone. Then you can enter for a trend continuation trade (sells in sell trend, buys in buy trend).

AVOID “Middle of Move” zones unless the reaction from opposing liquidity is weak (< 1H zones + weak momentum) or the reaction to opposing liquidity has not yet happened and you are just reinforcing an existing position.

ALWAYS enter on BEGINNING OF THE MOVE zones.

AVOID entering on “middle of the move” zones unless they have ALREADY been retested with strong reaction at least once.

NO entries on virgin zones unless they are beginning of the move.

Make this a rule.

Shahraja Singh [8:17 PM]
If you have an EXTREMELY wide stop loss? 10+ pips? Odds are you are entering at the wrong zone.

Look at what key zones are resting inside your stop loss. Setup entries there.

SL should usually be MAXIMUM 7 pips if you've really done the entry correctly.

SL TWO pips outside the zone.
Not 1.
Not 1.5
TWO full pips ALWAYS.
Avoid getting stopped out of good setups just because of 1 pip.

Pinned
Make sure S/D zones are also aligned with key support/resistance levels.

If there is a key resistance level that is holding strong and it aligns with a MoM supply zone - this is likely to be the supply zone price reacts from vs the BoM zone. In this case the MoM zone is valid.

This is why I've repeated that MoM zones are a case by case basis and are likely to be valid if they've been tested multiple times.

Unmitigated MoM zones should be avoided when a strong reaction from opposing liquidity is happening. In this case we prioritize entering on unmitigated BoM zones - because they are far less likely to be pierced by opposing liquidity.

In this scenario MoM zone is proven to be an area of resistance with 2 strong reactions - so it is a valid reaction point until structure is broken.

Support/Resistance fundamentals should be layered into S/D for extra confluence. (edited)

Let’s make it a habit to clear the charts and chart them fresh every single morning.
Any valid analysis I had the day before will be clearly visible on fresh charts.
Nothing will be lost other than ego and potential errors.
Daily habit. Fresh charts every morning.
Mandatory.

Practice this on backtesting too. Mandatory habit.
FRESH OPSEC of the terrain.
EVERY single time.

Leave NOTHING to chance.

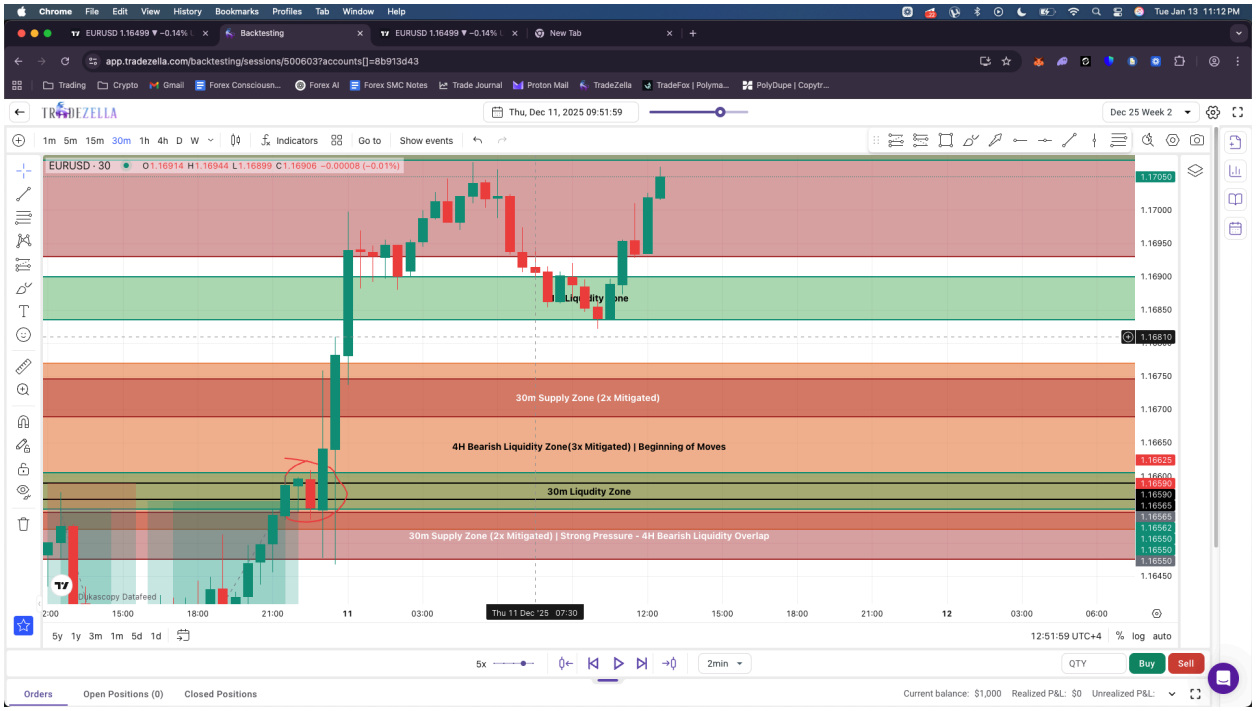

The trend for the week can be identified by understanding the storyline on the 4H timeframe.

It takes the 4H days and weeks to complete its storyline instead of hours and sessions.

Isn't it interesting how the liquidity zone became the OB for the breakout?

LIQUIDITY is what moves the market.

Map the liquidity and you map the price action.

Pinned

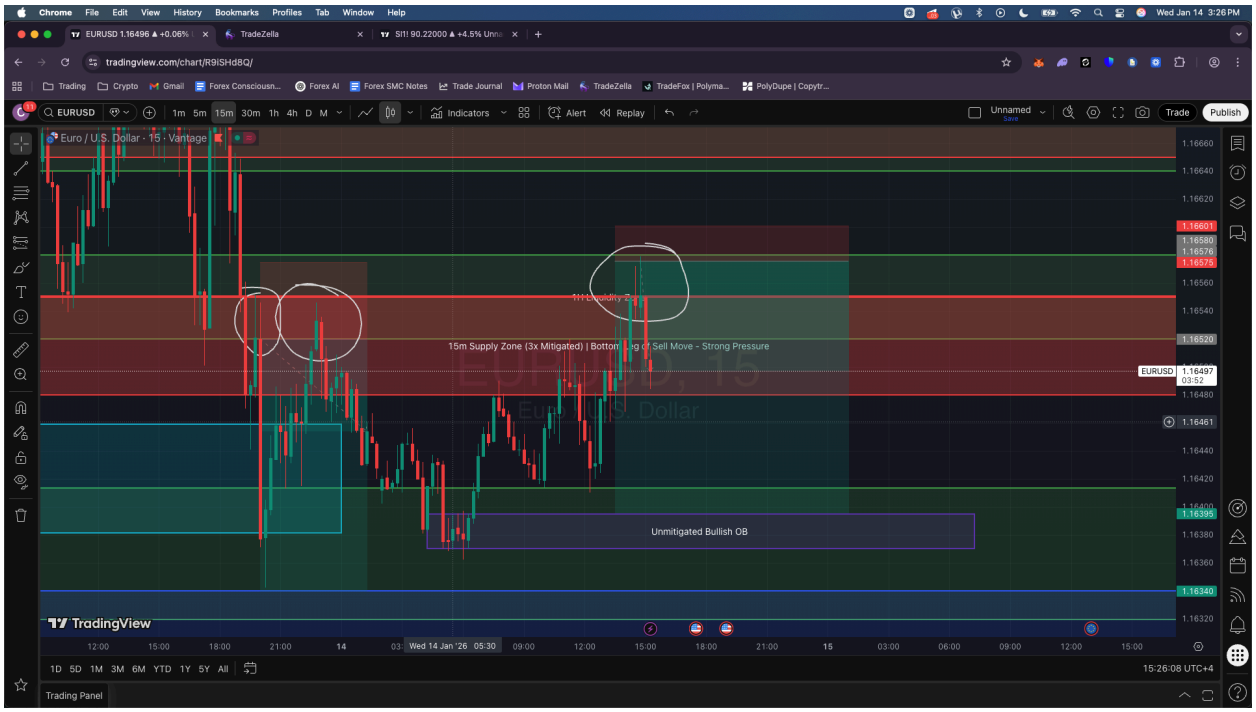

Trend Aligned Zones (Supply in sell, demand in buy) that cause a strong reaction will almost always have THREE strong reactions before the zone fails and gets pierced.

It can even be 4-5 - judge it based on the strength of the most recent reaction.

If there is such a zone in between the current price action and BoM zone, assume that price will fully liquidate this initial pressure zone before touching the BoM zone.

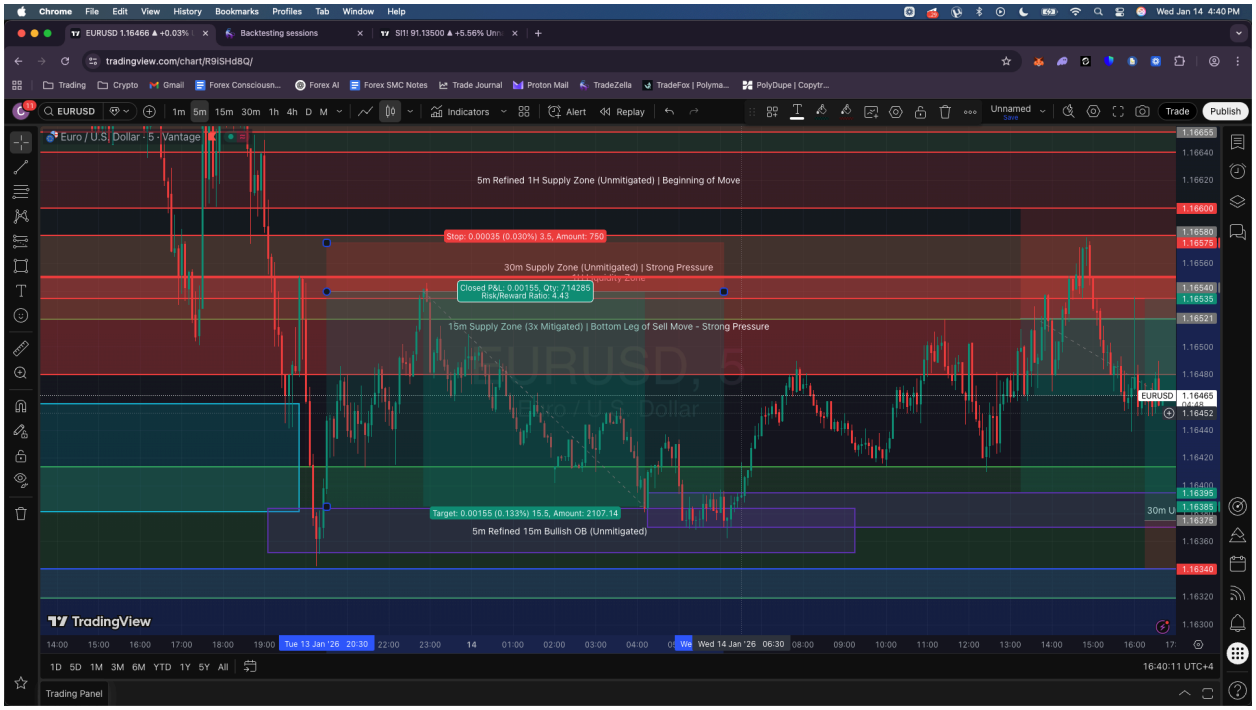

If this pressure zone still has juice left? (< 3 strong reactions, 3rd reaction is incredibly powerful implies 4th incoming, etc)

Use this pressure zone for entries/TPs. Leave the BoM zone for later (tomorrow or 2 days from now).

Ideal Trade Setup: Swing Scalps

- **SL:** 3-6 pips
- **TP:** 15-20 pips
- **Pattern:** 1-2-3 Reaction Pattern on a Strong Pressure Zone
- **Visual Cue:** Obvious Liquidity flow from Supply --> Demand, Demand --> Supply
- **Confirmation:** Double Trade Setups. Trade 1 --> Trade 2. Trade 2 cannot happen if Trade 1 doesn't work. If Trade 1 works BOTH Trades will work.
- **Analysis:** HTF Storyline creates fundamental structure for LTF Setups
- **Proof:** Easy to see, obvious mechanical price action.
- **Entry Strategy:** S/D + Liquidity Overlap

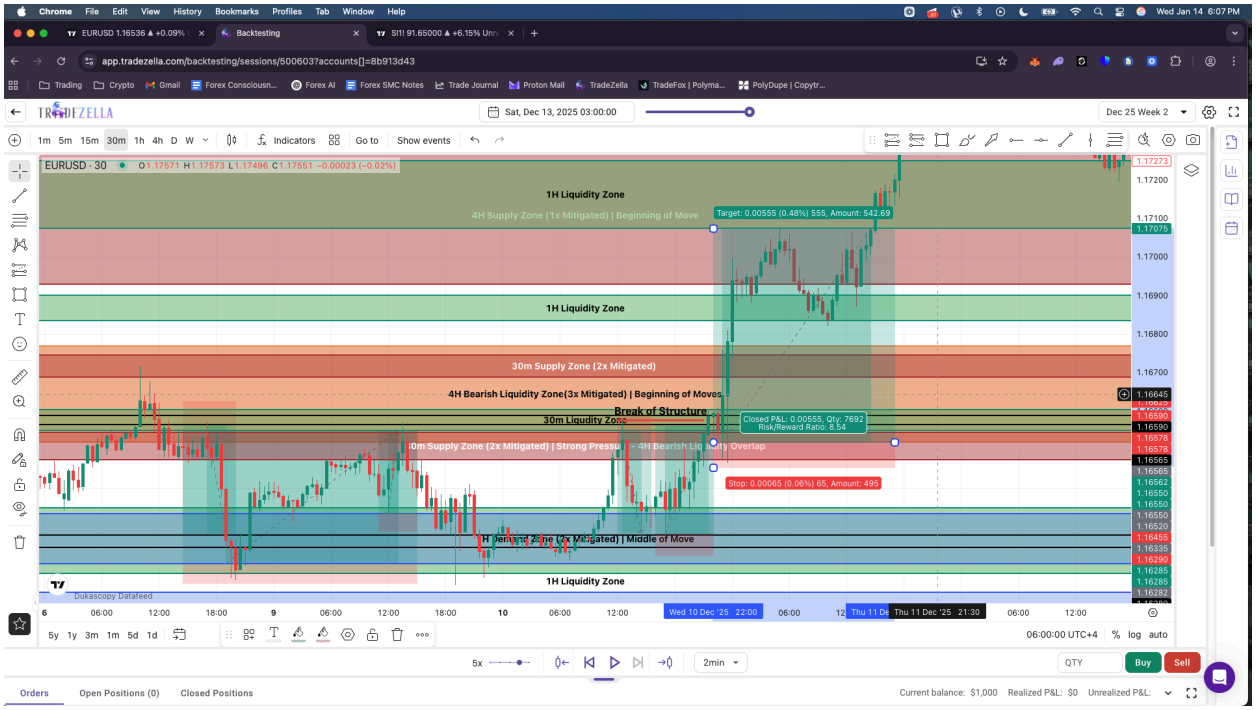

I am so glad we finally materialized this^

SL is ALWAYS at least half a pip INSIDE the next zone and never sitting on the edge. Either that or floating 2-3 pips past the edge of the zone.

Ideal Trade Setup #2: Breakout Surge

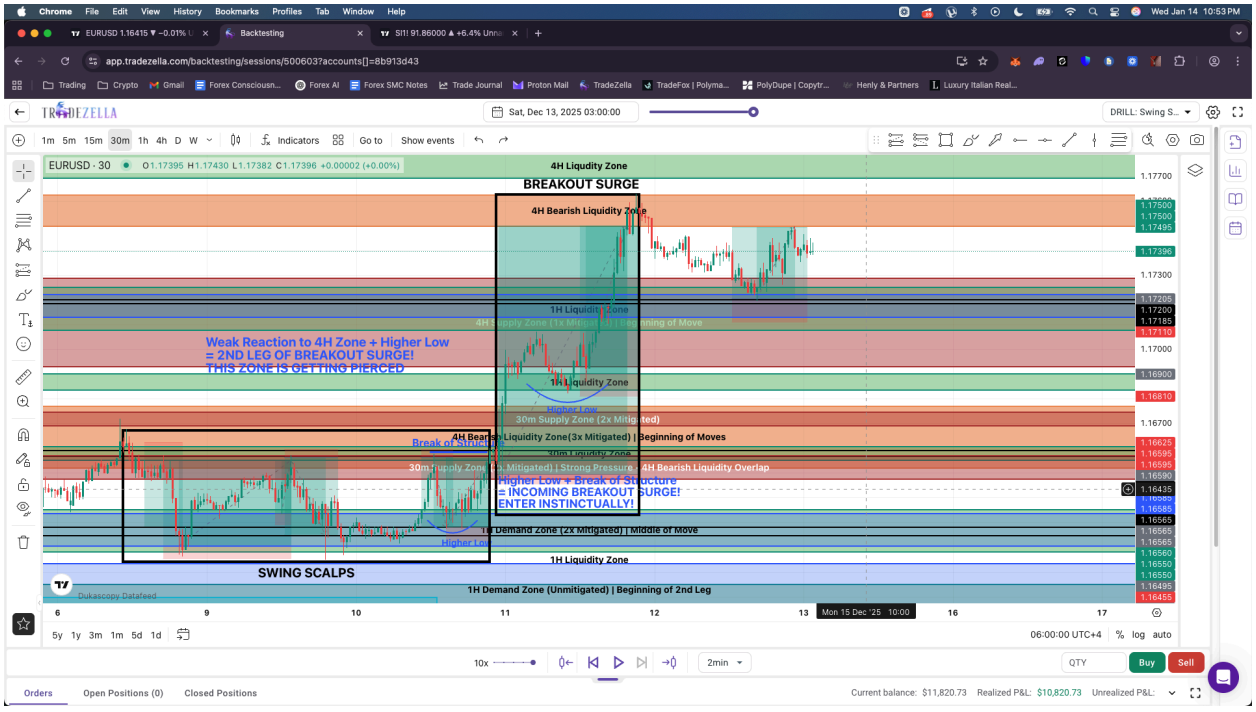

- **SL:** 8-12 pips
- **TP:** 40-60 pips
- **Pattern:** Piercing of Strong Pressure Zone - BoS Reversal Whiplash
- **Visual Cue:** 1-2-3 pattern complete, 3 move weak and beginning to break structure
- **Confirmation:** No real (unmitigated) opposing liquidity for 30+ pips
- **Analysis:** Pressure zone failing, market structure starting to break, price discovery breakout imminent to next zone of pressure
- **Proof:** No real opposing liquidity for 30+ pips. HTF Storyline confirms. **Swing scalp setups were building the consolidation for this move.**
- **Entry Strategy:** Broken S/D zone can flip into opposing liquidity and become a launch pad. Align with Liquidity

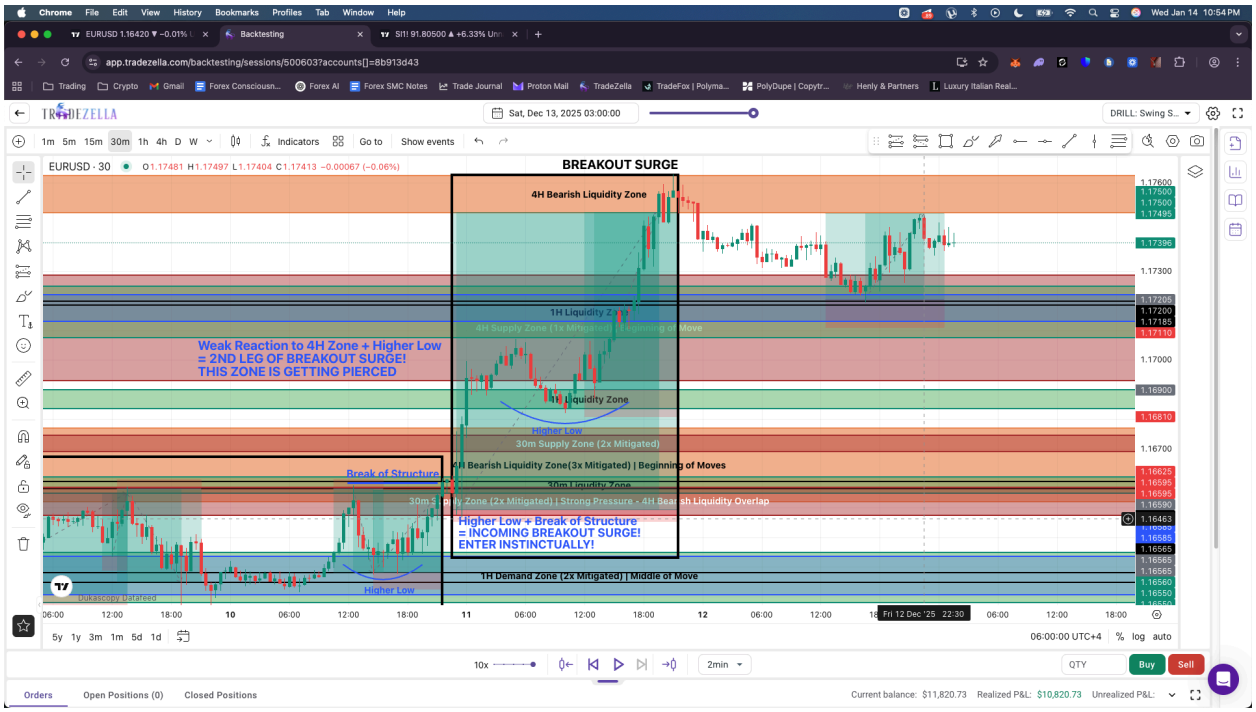

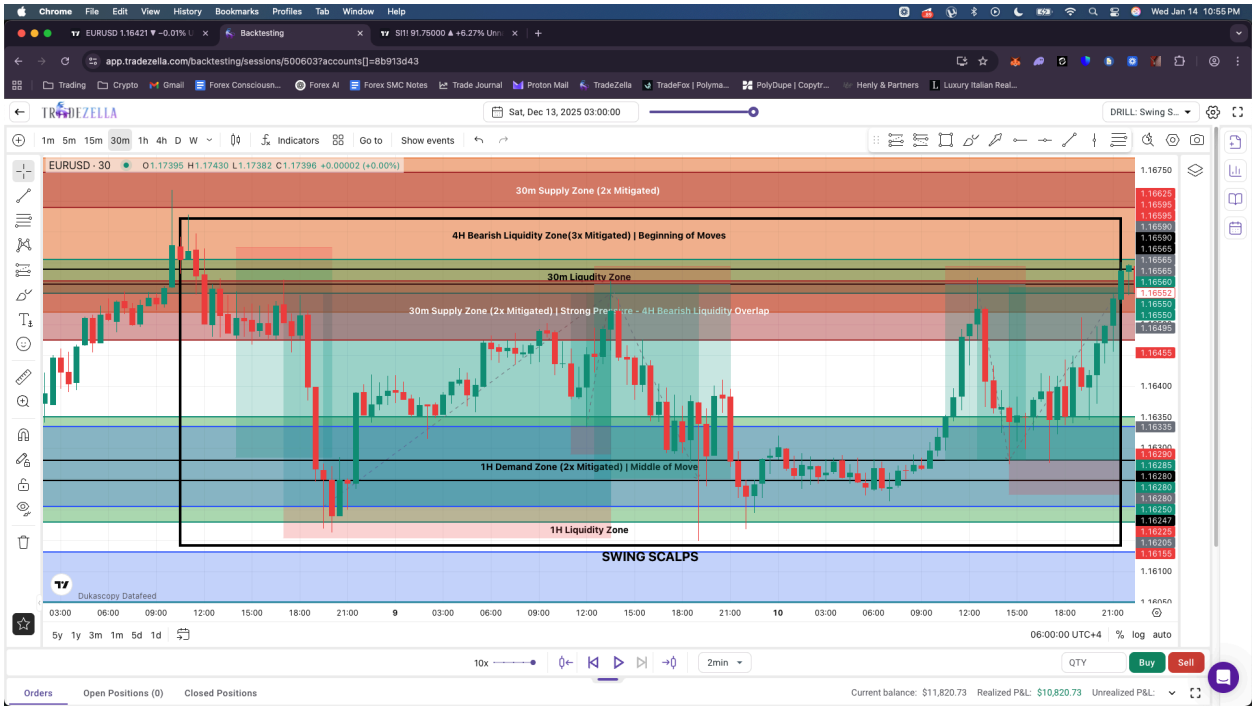

Ideal Trade Setups Look Like This

Swing Scalps & Breakout Surges

https://app.tradezella.com/backtesting/sessions/500603?accounts[]=8b913d43

EURUSD · 30
BREAKOUT SURGE

Swing Scalps --> Breakout Surge in the bearish direction.

1-2-3 completed on the support/bullish liquidity zones --> LOWER HIGH FORMS --> Break of bullish structure --> ENTER FOR SELL --> Bearish Breakout Surge Incoming.

6x RR

Notice how this "**4H Unmitigated Supply Zone - Beginning of Surge"** caused a STRONG reaction piercing every zone until it touched the NEXT **"4H Unmitigated BoM Zone".**

These are the STRONGEST possible pressure zones on the chart if it is **BoM Unmitigated 4H Liquidity.**

Moves that are caused by **BoM Unmitigated HTF liquidity** will usually pierce through everything until it reacts to liquidity of the same element.

- **Unmitigated HTF BoM liquidity (2nd Legs count)**

Each timeframe's liquidity is its own element and more likely to react to liquidity that matches its element.

4H liquidity --> 4H liquidity

1H liquidity --> 1H liquidity.

30m --> 30m liquidity

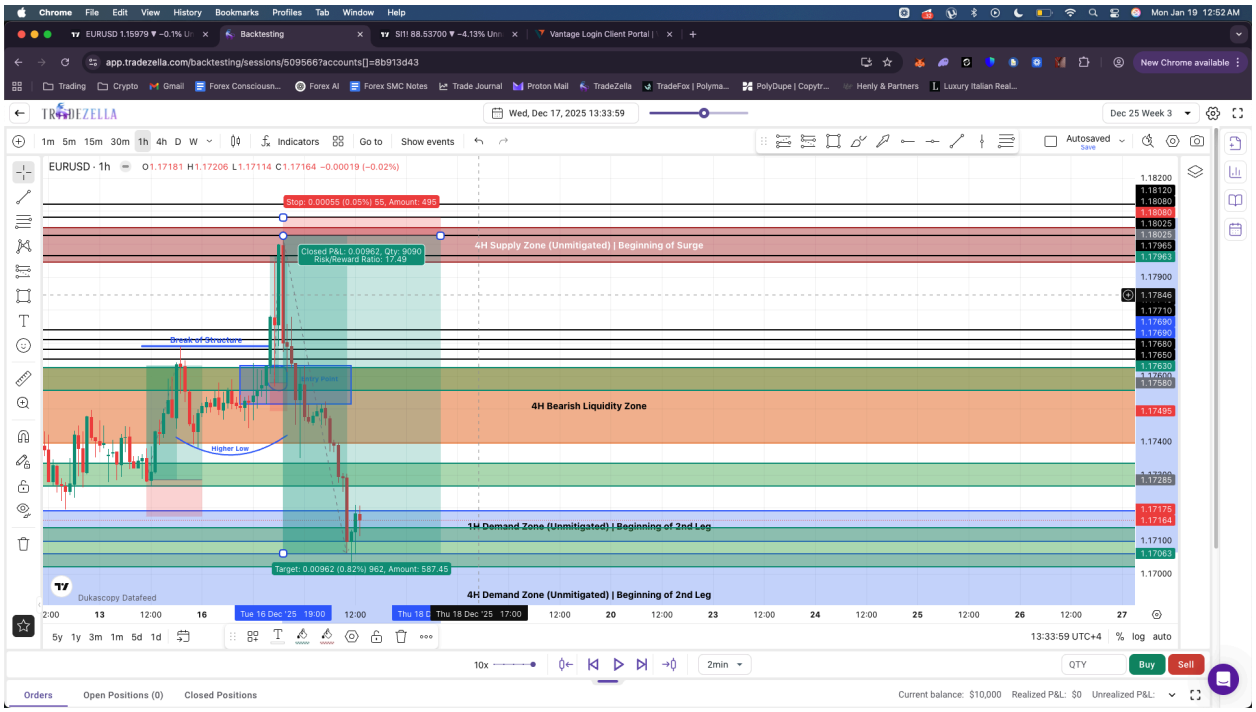

LTF liquidity is more likely to be "absorbed" by HTF liquidity - but usually never more than 2 dimensions of liquidity up.

Examples:

- Surge begins on 15m liquidity ends on 30m liquidity
- Surge begins on 15m liquidity ends on 1H liquidity
- Whiplash begins on 1H liquidity ends on 4H liquidity
- Whiplash begins on 15m liquidity ends on 1H liquidity

1H & 4H Liquidity react to one another as similar elements.

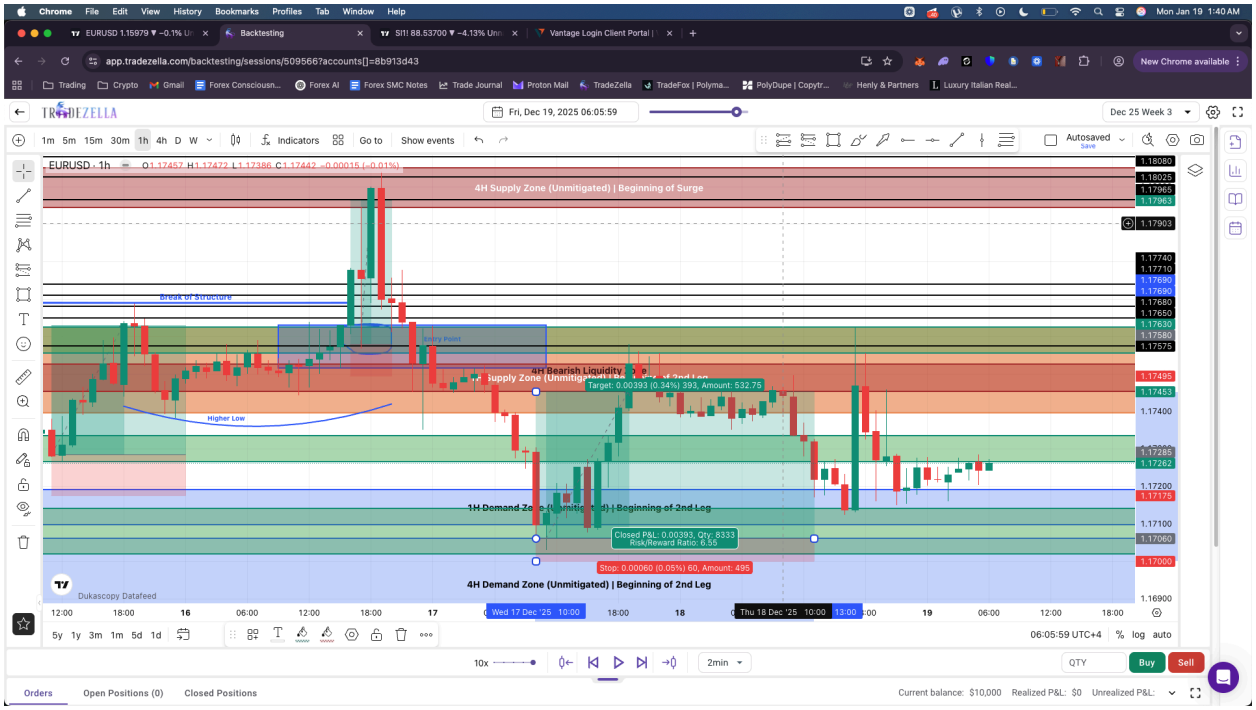

1H/4H Liquidity can be used interchangeable with 4H liquidity being the dominant pressure zone in unmitigated BoM areas (edited)

NEW VARIATION IDENTIFIED:

Recovery Surge

Post-whiplash recovery leads to a minor surge in the reverse direction - until BoM Unmitigated HTF Liquidity

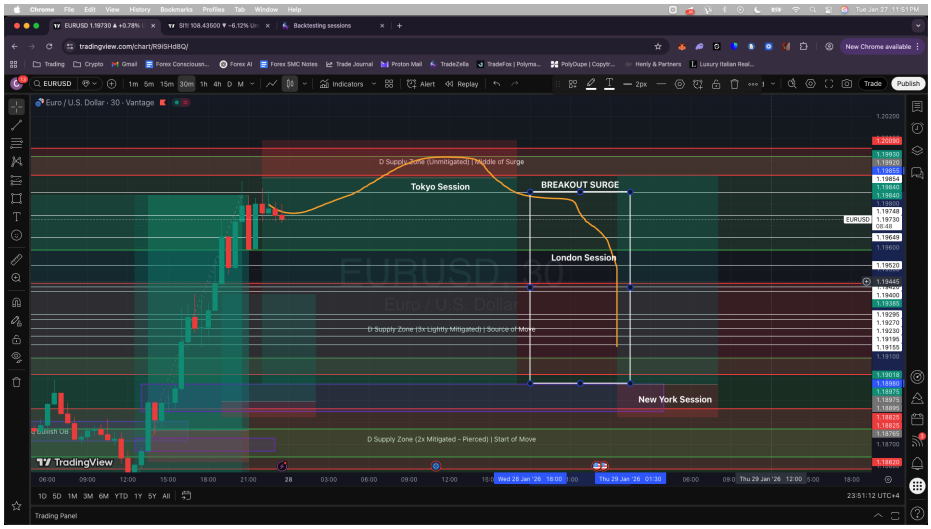

Unmitigated Beginning/Source of move zones are **100% GUARANTEED** to have a reaction when touched.

Setup trades accordingly.

Get in the habit of **DRAWING THE CHART** on live markets.

The better I get at drawing the chart correctly, the easier it will become for me to see what the chart does.

Every session open/close - draw the charts

==========

4H Zone Mechanics:

- MoM zones will cause at least 1 reaction if UM
    - After the first reaction - see how the price action reacts:
        - Does it reverse whiplash instantly? ~ All liquidity drained. | **Pierced ~ BS/Whiplash**
        - Does it have a minor reaction & retest? Does the zone hold?
            - Zone holds **| Long Consolidation ~ Swing Scalps**
            - Zone breaks but price returns **| Short Consolidation ~ SS --> BS/Whiplash**
    - If the price does not pierce or sharply whiplash upon testing the zone, expect a slow consolidation around this POI for 2-4 days.
        - Consolidation will end in price retesting the opposing liquidity and then pierce through the zone until reaching the BoM Liquidity

==========

<u>Trades often take twice as long as you think they will.</u>

Pierced zones usually do not get pierced instantly.

First they have a reaction and THEN they get pierced.

Pinned by you
Shahraja Singh [2:52 PM]

In choppy slow markets:

- Drop down to the 15m timeframe and map local liquidity.
- Catch the obvious 20 pip trade setups.

PROMISE you there are at least 5-8 solid trade setups inside of chop.

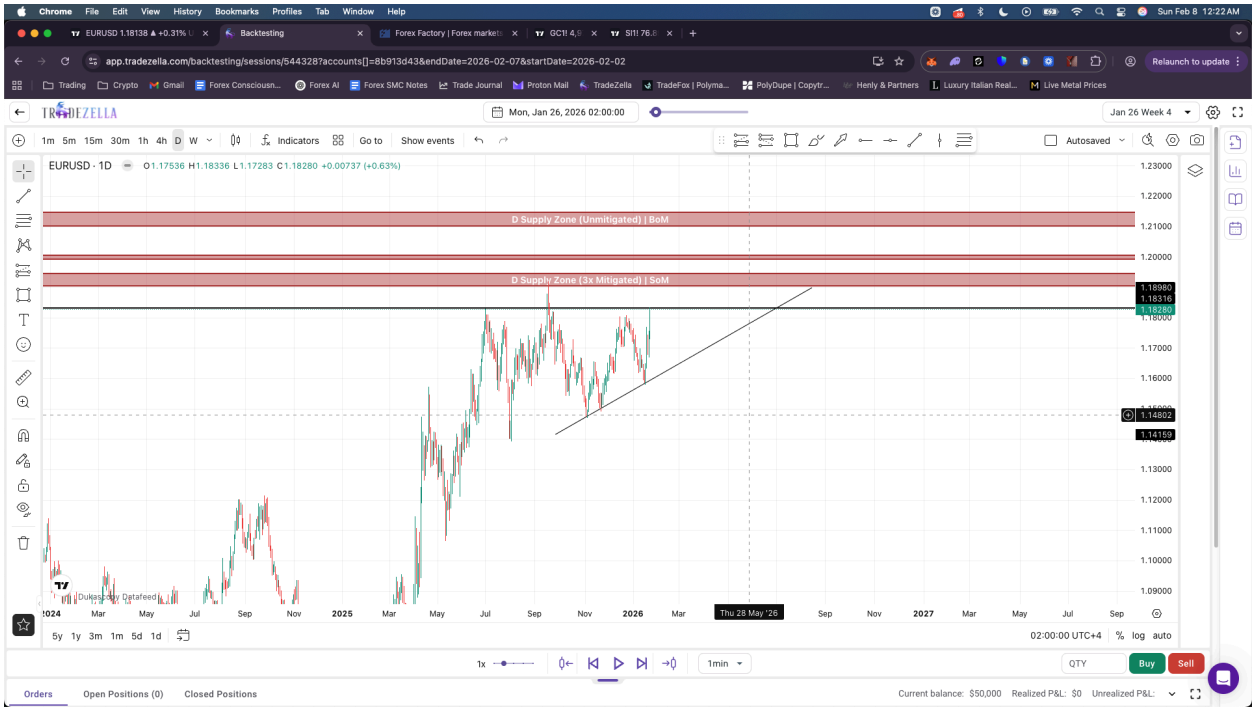

Zoom down. 15m timeframe. 5m precision. Intraday storyline.

Snipe the liquidity.

Whenever there is a triangle shape on the chart - the “flat” side is usually the one receiving the pressure.

The “sharp” side is usually the one applying the pressure.

This is how we can read pressure flow in the chart

New Rule: SL must be at least **2.5 pips** or 3 pips. NOT 2 pips.

(1.5 pips if scalping on the 5m)

Pinned by you
Shahraja Singh [10:23 AM]

My main mistake is I keep defaulting to seeing every trade as a breakout surge unconsciously.

Look at the 30m/1H chart. What is price doing right now?

- Beginning/middle of consolidation?
    - Look for **SWING SCALPS**
        - **Look at the 5m timeframe and identify trade setups**
            - Align on the 15m
            - DON’T LOOK AT THE 5M AFTER SETTING UP THE TRADE. WATCH IT ON THE 15
    - Price is going to spend the next 1-3 days consolidating.
        - Look for 10-30 pip swing scalp trades.

        - Snipe the micro moves. Easy af
- End of consolidation near HTF pressure zone?
    - Breakout surge incoming.
        - NOW you can snipe the big HTF moves
- Middle of breakout?
    - Map the existing breakout surge and reinforce on liquidity zones
- Post breakout recovery?
    - Look for whiplash opportunities
        - If there are none default to swing scalps.

If we are not right near a strong 4H pressure zone **right now** - BS is most likely days away.
And right now is swing scalp valley. MILK the fucking cow on the 5m timeframe.

Pinned by you
Shahraja Singh [10:39 AM]
Bro. Drill scalping on the 5m chart.

WE CAN BE PRINTING FUCKING DOUGH FROM INSIDE THE HTF MOVES!!!!!!

Inside of ONE intraday 6x RR swing - **THERE IS LITERALLY 24X WORTH OF 5M SWING SCALPS TO BE TAKEN FROM INSIDE THE MOVE!!!!!!! 30X TOTAL FOR THE DAY!!!!!!!**

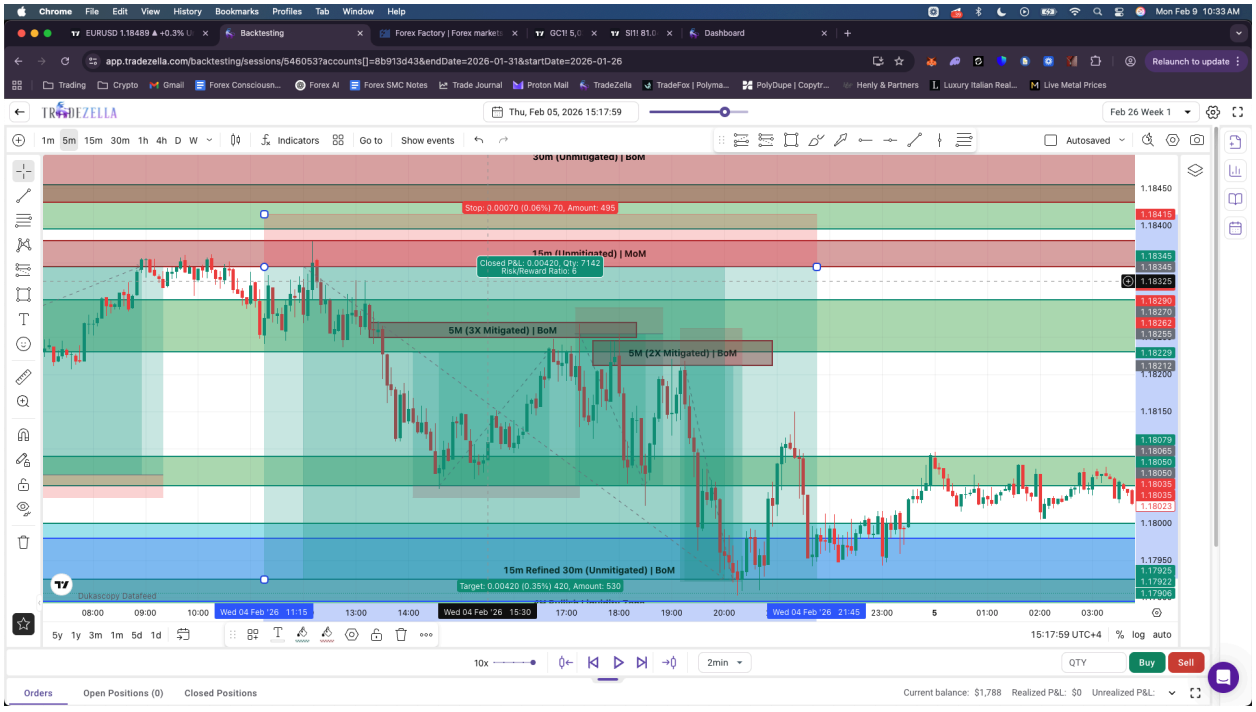

Imagine that inside of every HTF swing you catch - there is an extra 4x the RR sitting inside of it just by liquidity sniping the 5m swing scalps **that complete the HTF swing.**

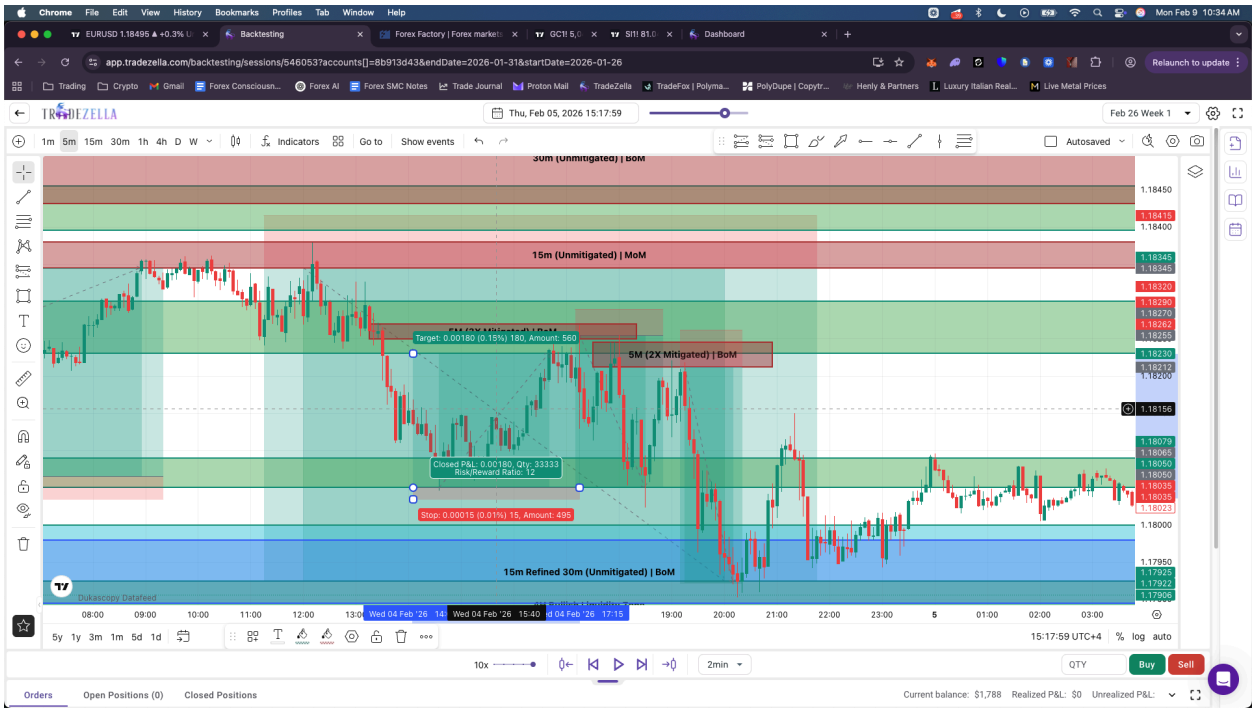

Literally guaranteed price action. The trade HAS to move between these liquidity zones in order to reach the TP POI.

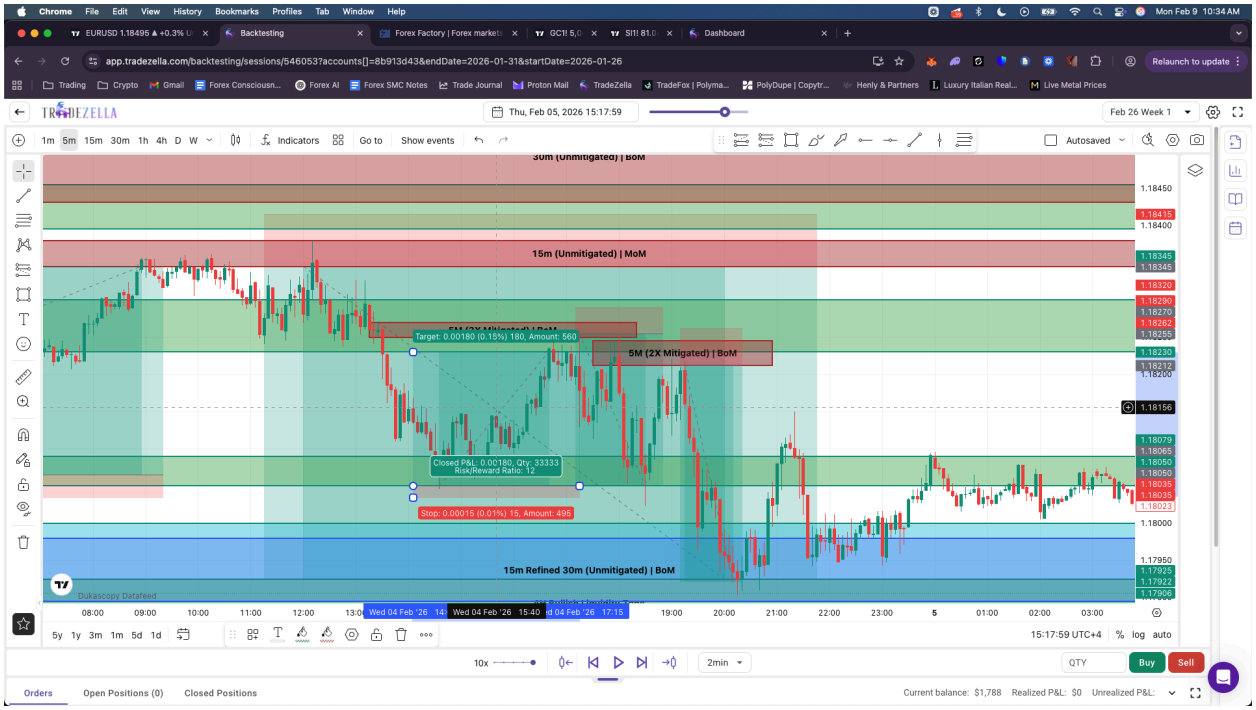

It is 100% guaranteed to react off every liquidity zone it has not yet touched since beginning the move.

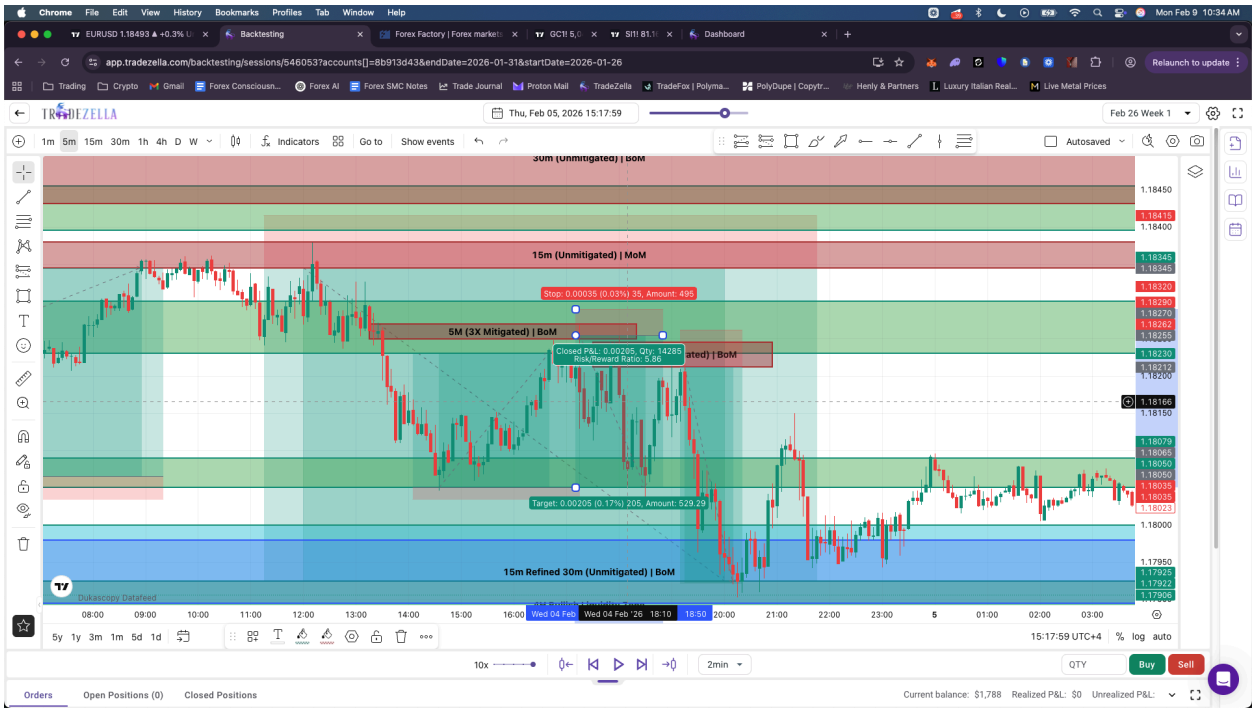

The money is made just catching the movement from one liquidity zone to another. It is already moving. Free money.

Add 5m S/D zones for extra precision, adjust SLs to be 1.5 pips outside the S/D zone instead of liquidity - FREE SNIPES. EASIEST MONEY EVER.
HTF ALREADY CONFIRMS EVERY SINGLE MOVE.

We should us **stop orders** for reinforcements like we use limit orders on entries.

Just map the liquidity ladder + reinforcement setups, once entry is confirmed and starts moving - we can place stop orders on the far edge of each liquidity zone for reinforcements.

We want to enter on the FAR edge from the price action to ensure the zone actually breaks and will get pierced through before entering so that we avoid unnecessary losses. That way if price reacts to the liquidity zone and rebounds we are not entering and losing capital. We only enter once the zone actually gets pierced so it's as close to free money as possible.

Most of my trades hit TP during NY session.

London RARELY has ANY trading opportunities.

- Usually just entries for trades that TP in NY, OR LTF scalps.

Knowing this - we should STOP psyching out from london session volatility.

Trade mechanics, get good entries, FORGET until evening.

London = load up on entries
NY = watch the fireworks
Tokyo = milk the cow/sleep

GU provides MORE London session trading opportunities than EU.

3-4x more.

Look on the 5m chart and use basic common sense.

<u>LONDON SESSION IS FOR SCALPING.</u>

95% OF NY SWINGS <u>DON'T EVEN START UNTIL THE 2ND HALF OF NY SESSION!</u>
Do not worry about missing moves.
Take profits. Catch the tiny moves of 10-15 pips <u>ON ALL CHARTS</u> during London session.
We can enter for NY swings at the end of London + the beginning of NY.
DO NOT WORRY about missing the move.
Surf the waves.
Scalp the entire London session price action on GU + AU
Then after gym + lunch - setup the highest RRR swing entries.
Let NY session OPEN fill the entries for NY session moves.
We can literally catch 10x on scalps if we do them right.
Optimize London Session scalping.
Instead of waiting until 10pm to even catch profits - this should be the 2nd wave of money for the day.
Primary 5m scalping pairs:

- GU

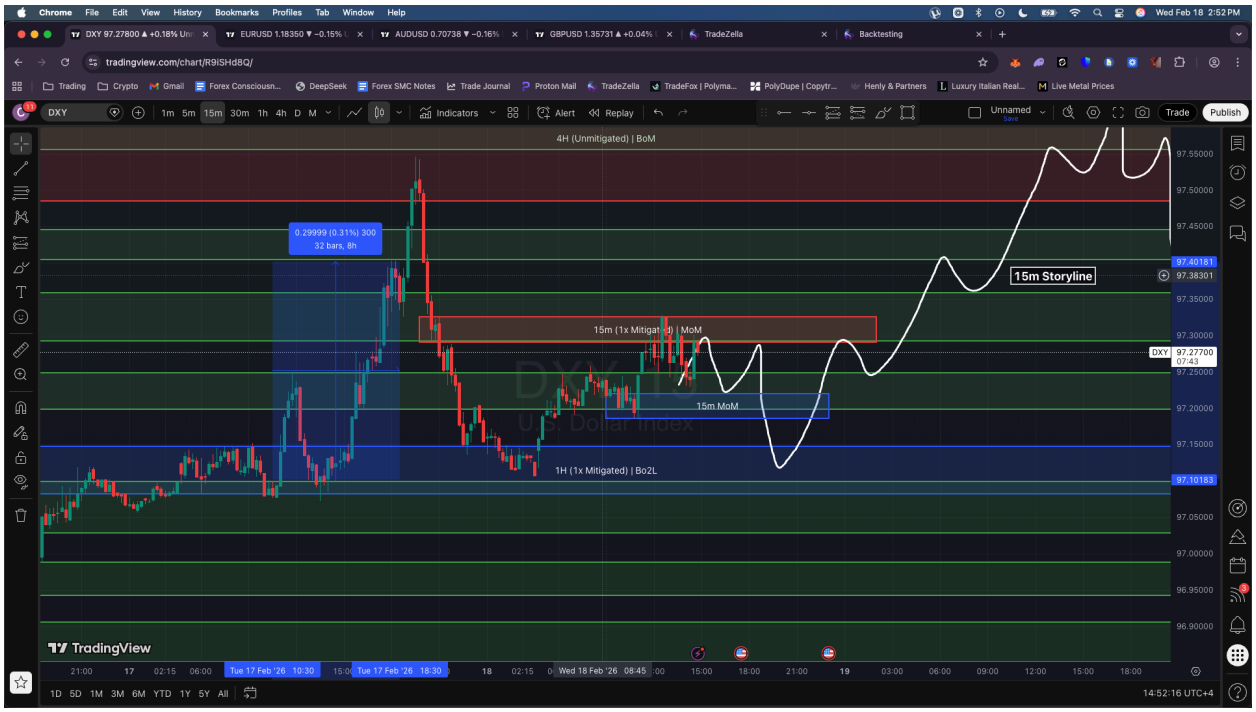

- AU
- EU
- Gold

Notice how DXY literally only moves from ONE liquidity zone to the other for basically the entire London session.

The breakout surge doesn't even START until 3pm.

Expect London session price action to be weak and reactive.

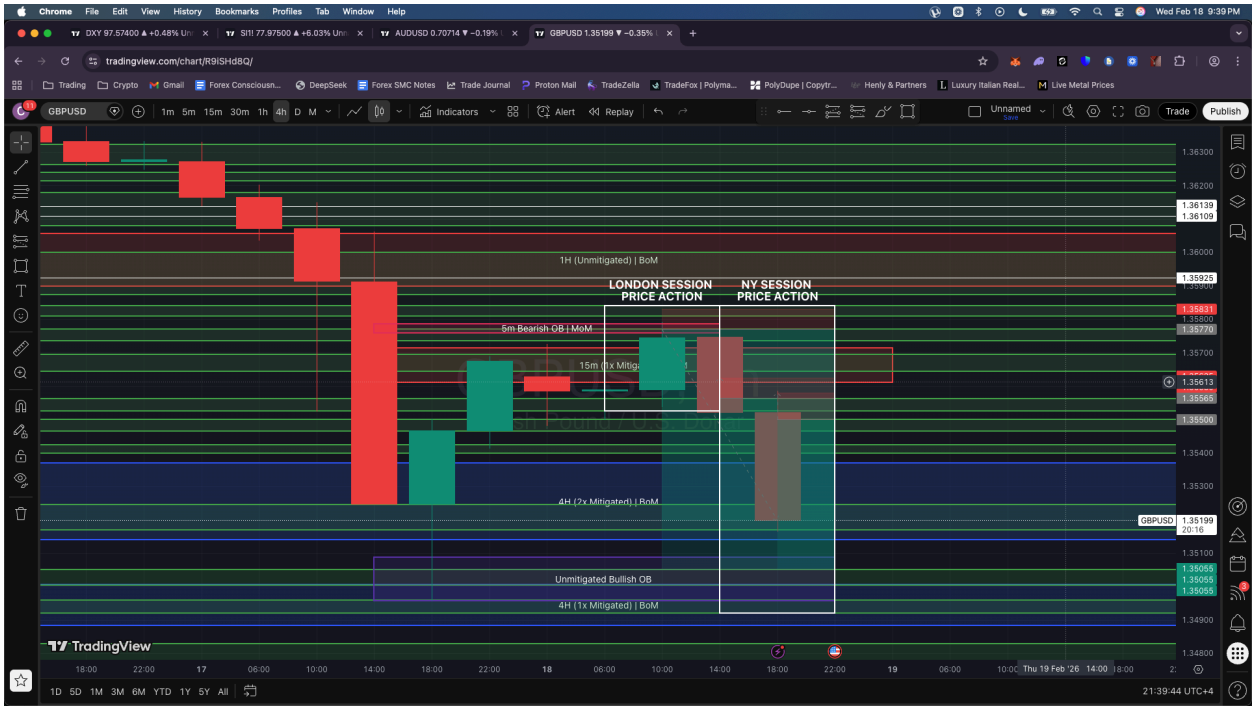

Strong moves only come towards the end, after liquidity has been swept, and once NY is ready to start dominating.

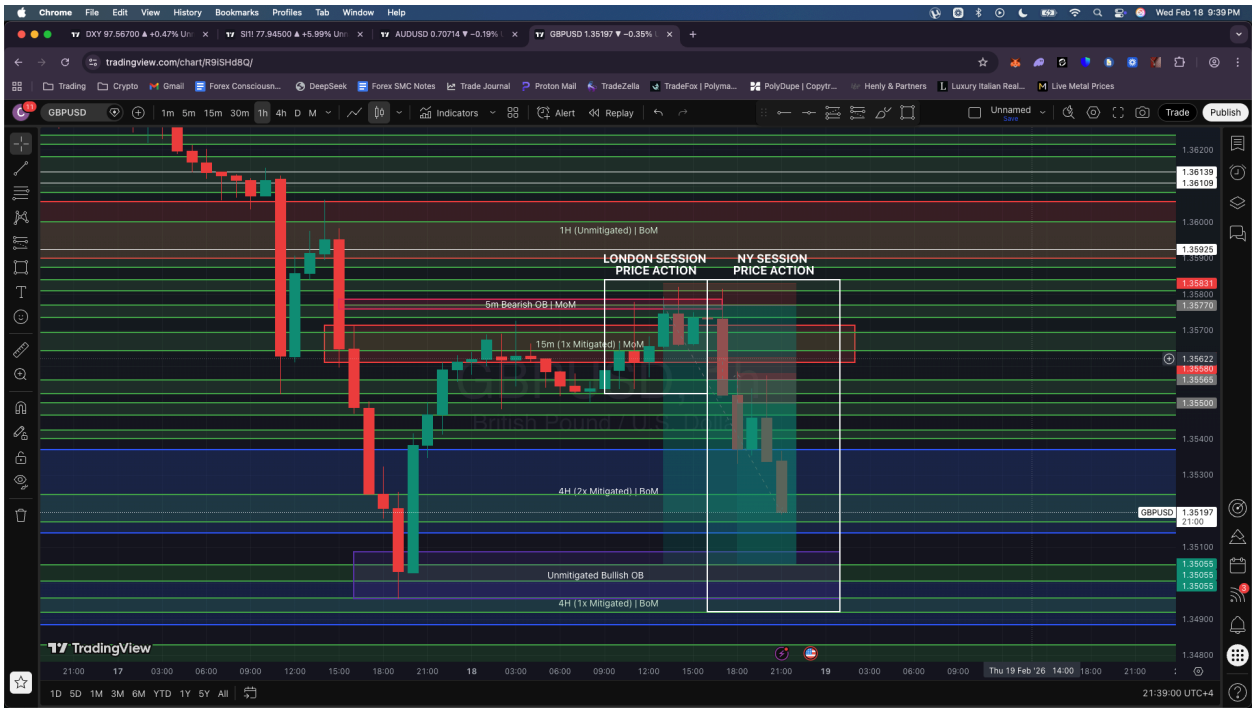

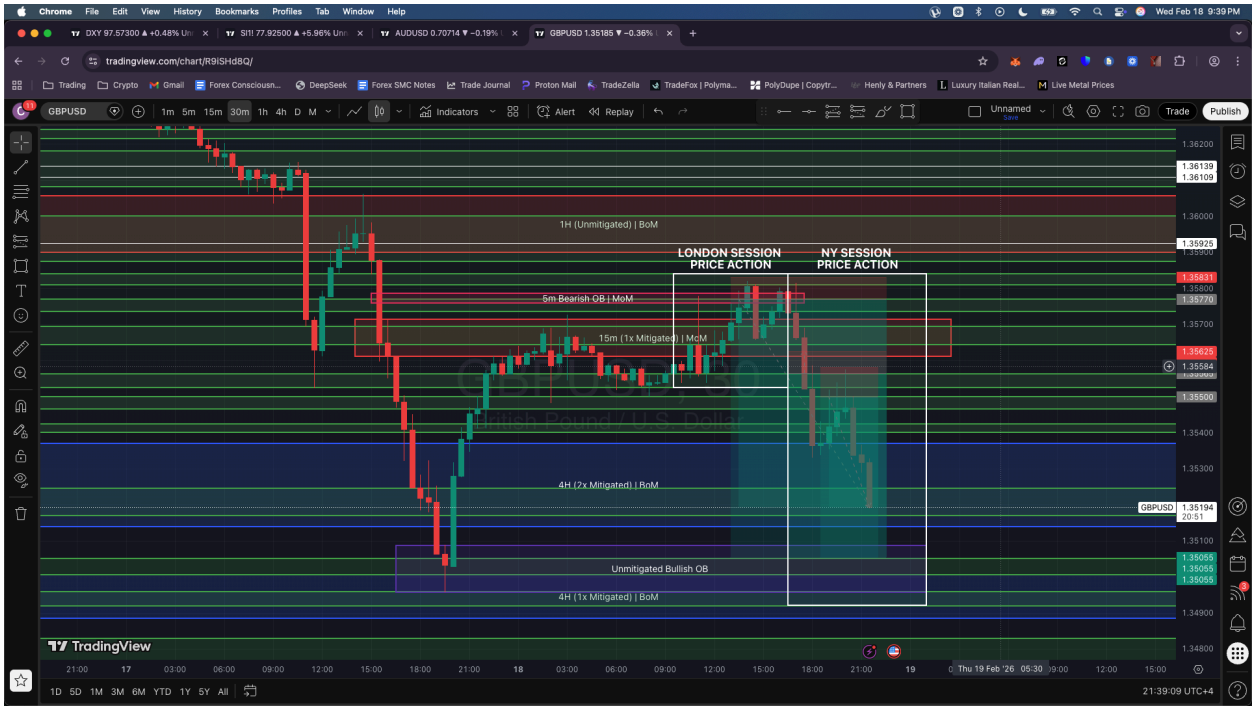

Factor this in to ALL future trade analyses

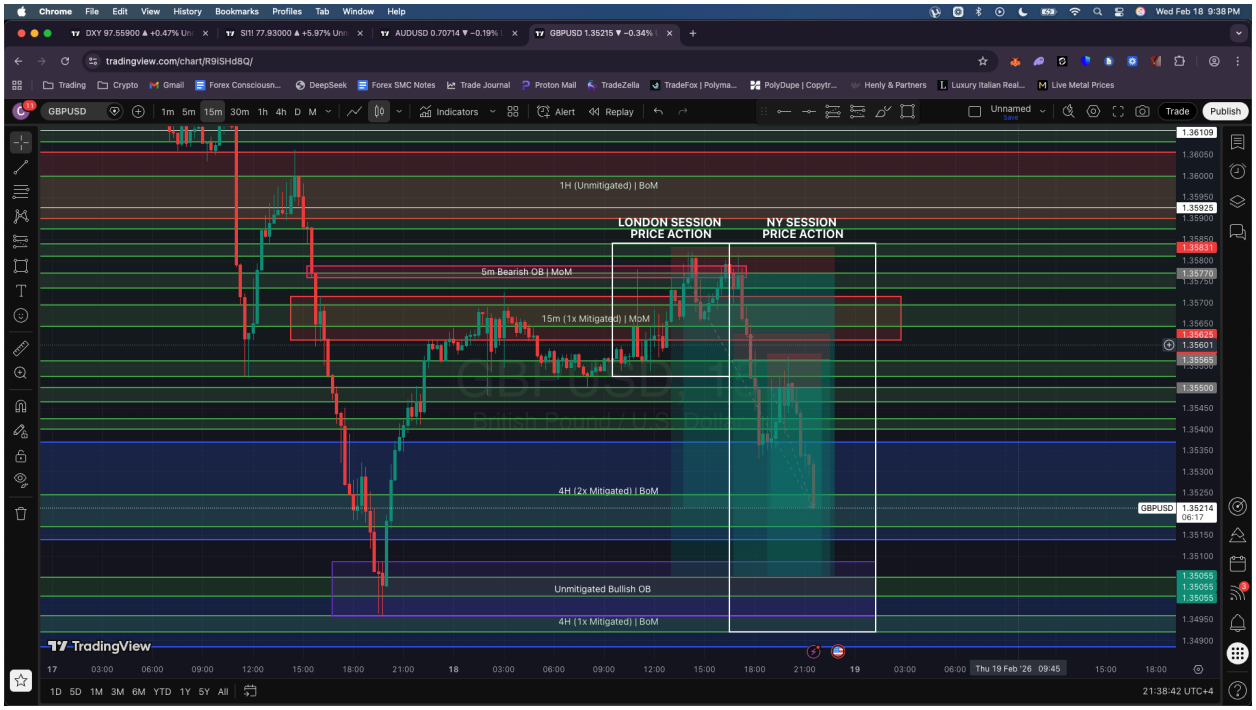

Notice how London Session vs NY Session price action looks on each timeframe.

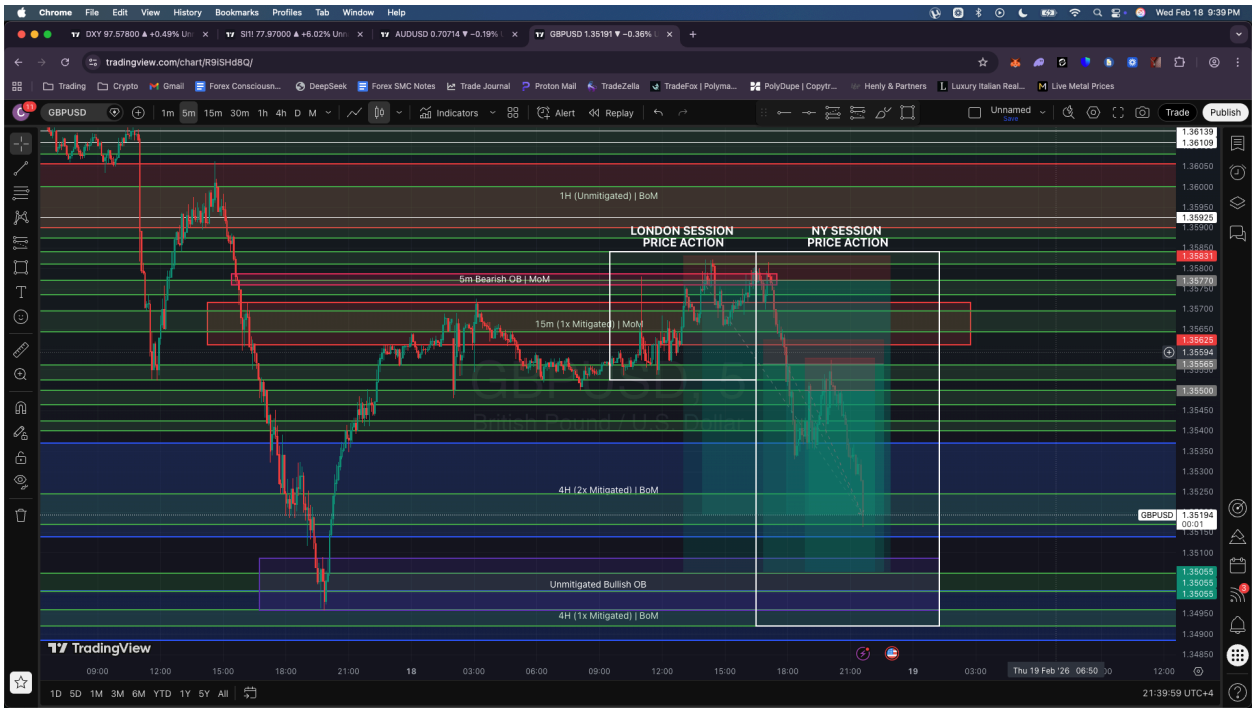

Setup trades accordingly.

Also notice how using the Fibonacci tool on the 30m chart reveals **exactly where the lower high will form** in the chart (between .382 & .618)

Use this in the entry checklist to accurately map where price will react from.

(this is where we can decide where to place reinforcements)

Fibonacci Reinforcement Rockets

.382 | .618 | .786

These are the key levels price is likely to react to.

Engineer rockets accordingly

Look at how PERFECTLY the trade is built by the Fibo.

Entry at 0.618 - 0.786

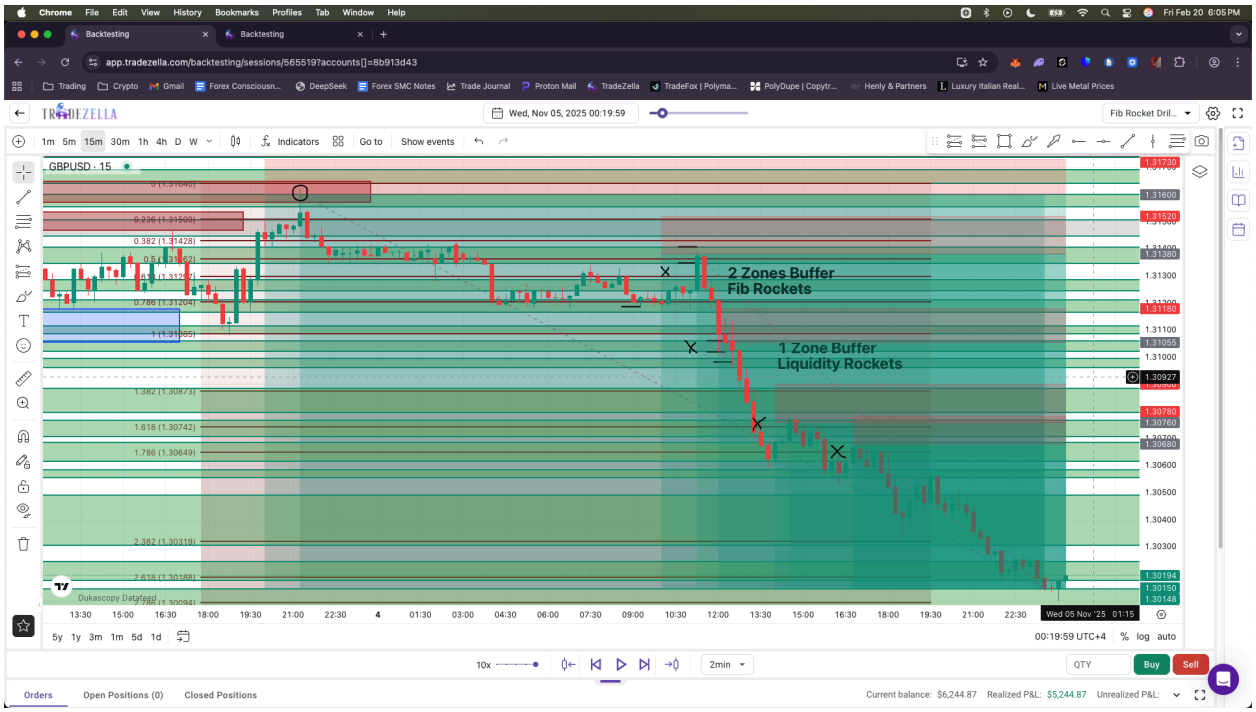

Rockets on 1.382 - 1.786

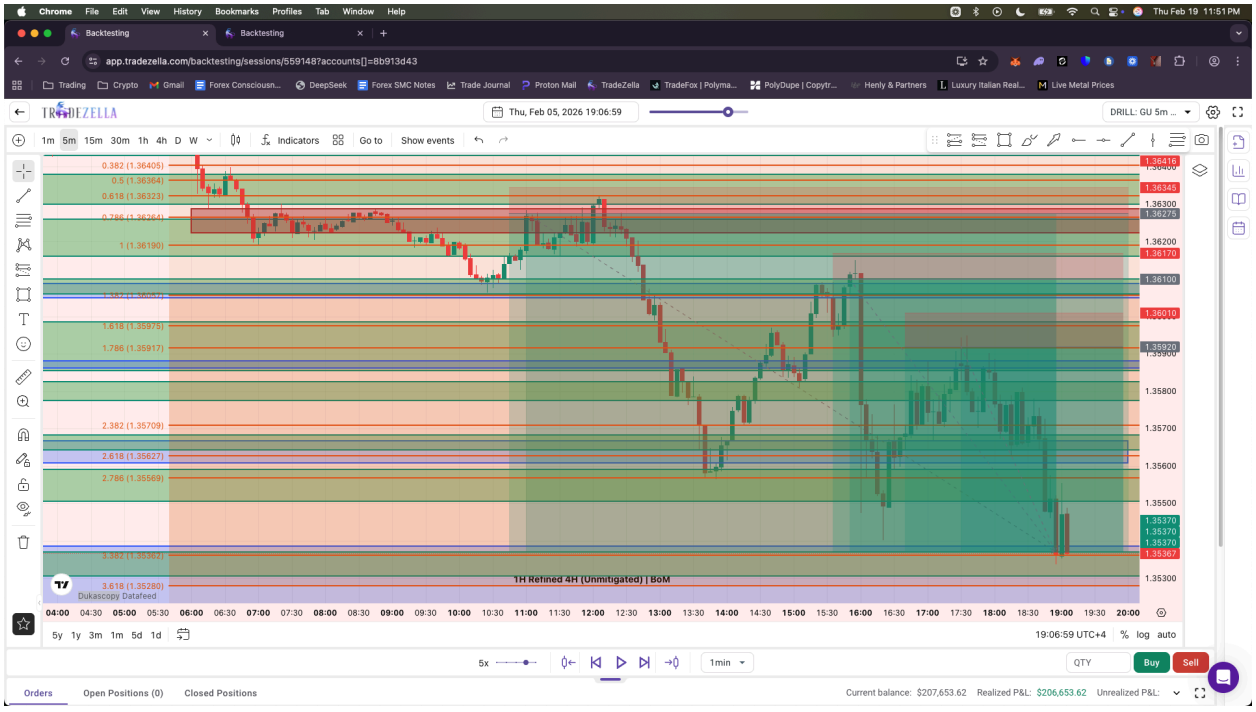

Triggers on 2.382 - 2.786

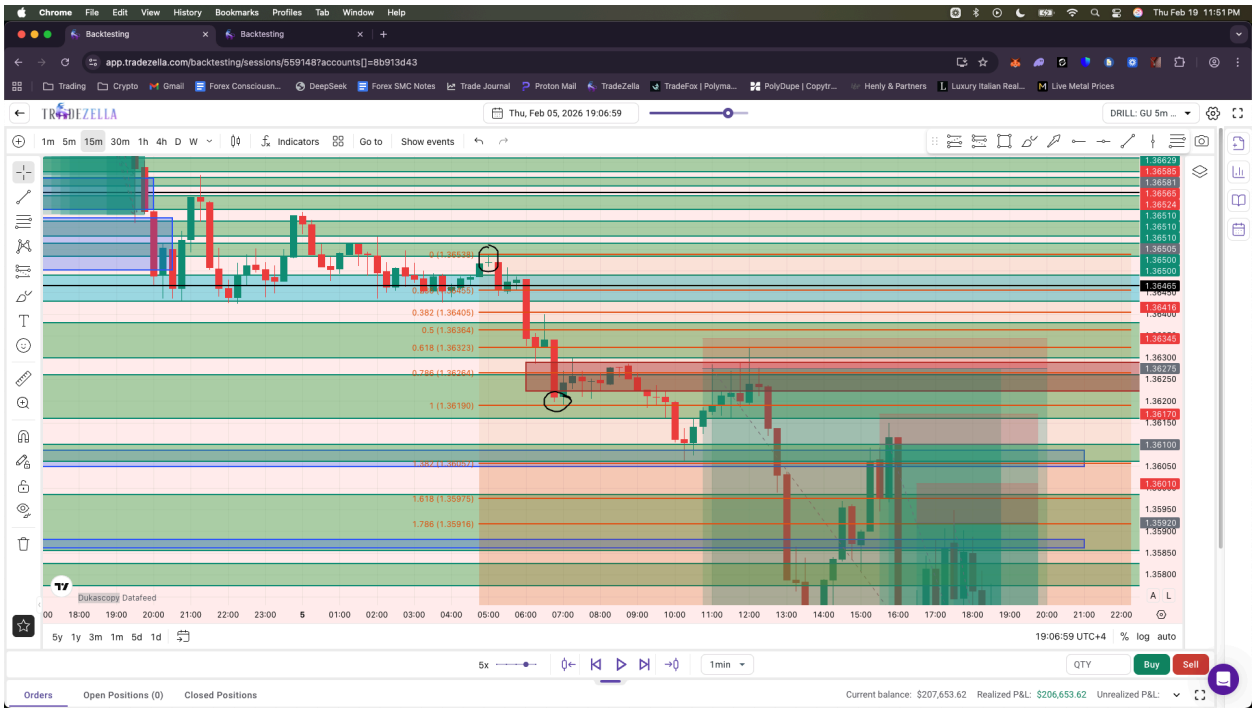

TP at 3.382 - 3.786

One can literally just chart the liquidity ladder - align with the 4H storyline - and setup the entire trade around the fibonacci tool.

It will react perfectly.

Even in shorter moves the same levels are key POIs

Entry < .382

Rockets on 0.618 - 0.786

Triggers on 1.382 - 1.786

TP at 2.382 - 2.786

Tighter fibo mapping is better.

Precision.

Nearest relevant swing highs/lows

Remember that NY session rockets require 3 PIP SLs. Or they explode.

When GBP has high impact news you can usually expect it to pump 2 liquidity zones.
In rare cases it will whiplash to the 4H POI

Not every rocket will hit the target.

Some rockets WILL explode.

There is a 20-30% failure rate in the rocket system - but that is COMPLETELY FINE.

This is a game of probabilities.

A 70-80% success rate is AMAZING already and does not require any further optimization.

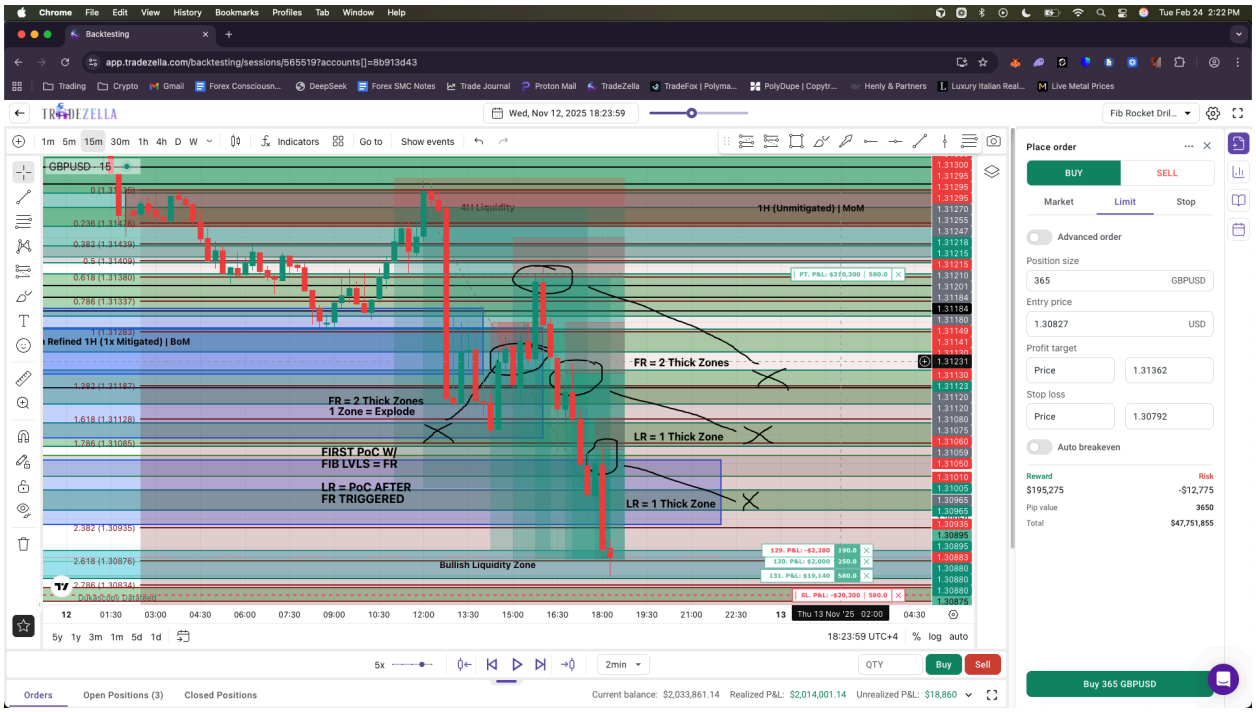

I am absolutely content to have 20-30% of rockets explode and have a trading system that is as hands free and systemized as this.

When mapping FLR - the FIRST point of contact with Fibonacci levels **must be mapped as a Fibonacci Rocket w/ 2 thick or 3 thin liquidity zone buffers.**

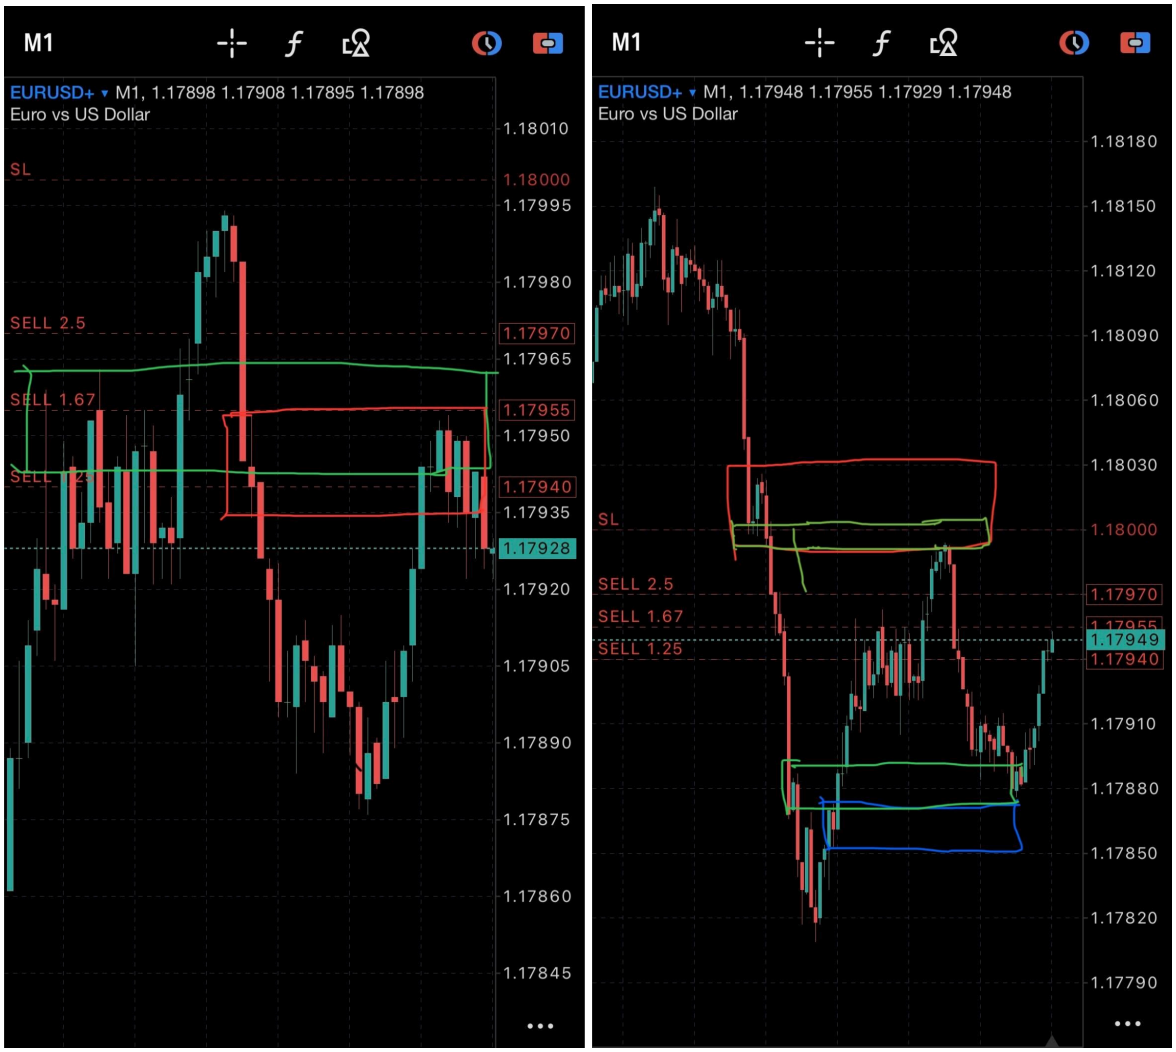

Subsequent points of contact with the same fib level can be mapped as Liquidity rockets with only 1 thick or 2-3 thin zone buffers.

If a Key 1-2 Fibonacci level is UNMITIGATED - the rockets must be setup as FR.

After the Fib level has been mitigated by an FR setup - then it can be setup as LR.

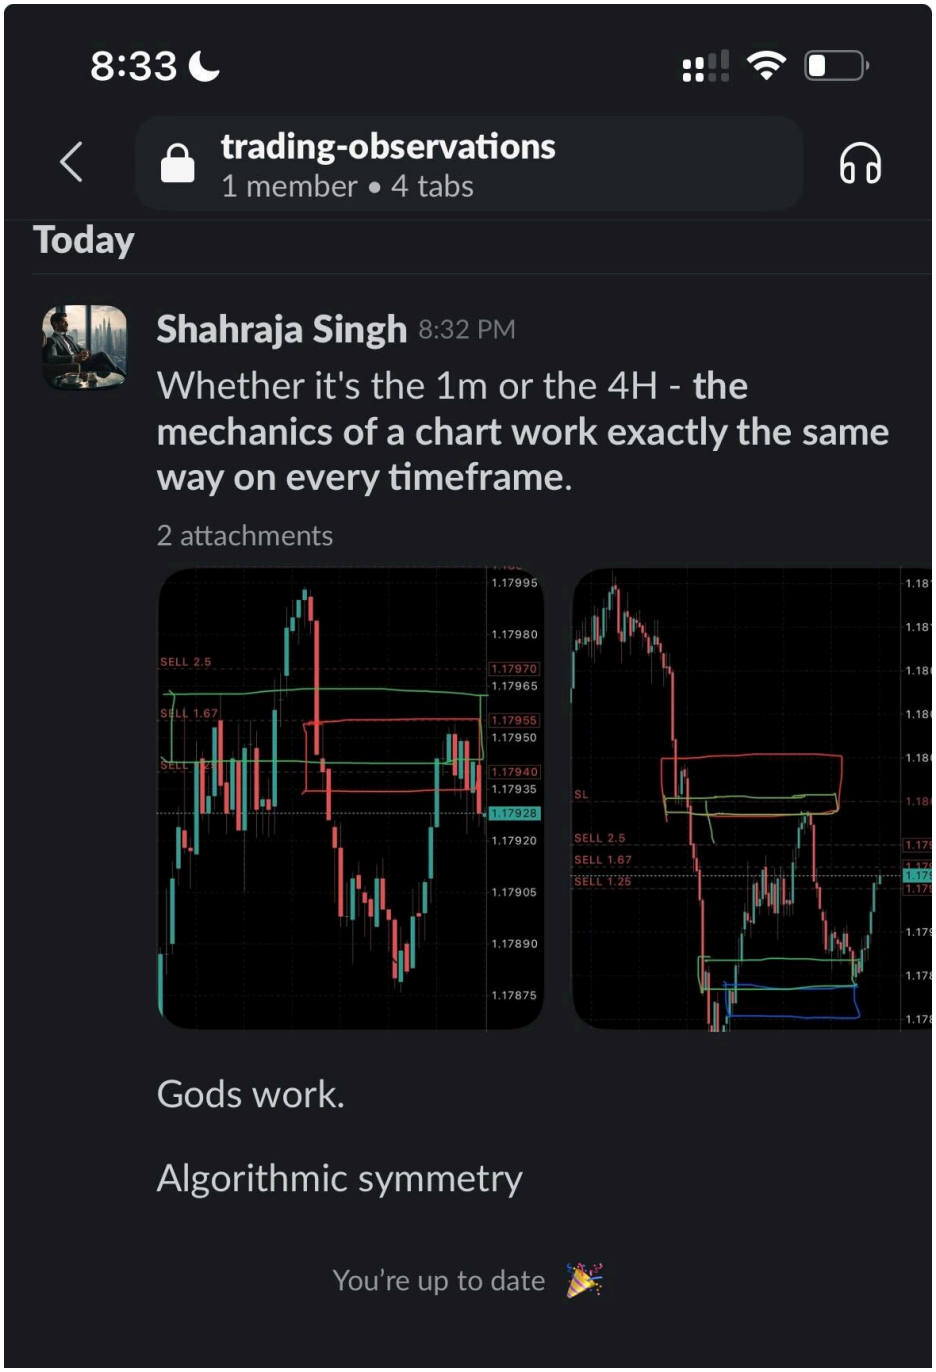

Whether it's the 1m or the 4H - **the mechanics of a chart work exactly the same way on every timeframe**.

Gods work.

Algorithmic symmetry

Divine pathway to wealth and abundance

When setting up multi zone targets - make sure there is always at least 2 entries inside the stop loss overlapping the trades.

Before stop loss hits in trade 1, 2+ entries should open for trade 2.

This will prevent missing the move in correct analyses.

When the trade gets within 70-80% of the TP and starts reacting/consolidating - we should move the SL up to 65-70% profit

And reset the entries from BoM to re-enter the move if it corrects strongly.

Whenever it comes to "decision points" in the direction of the price action - 4H Storyline Bias will often decide the direction.

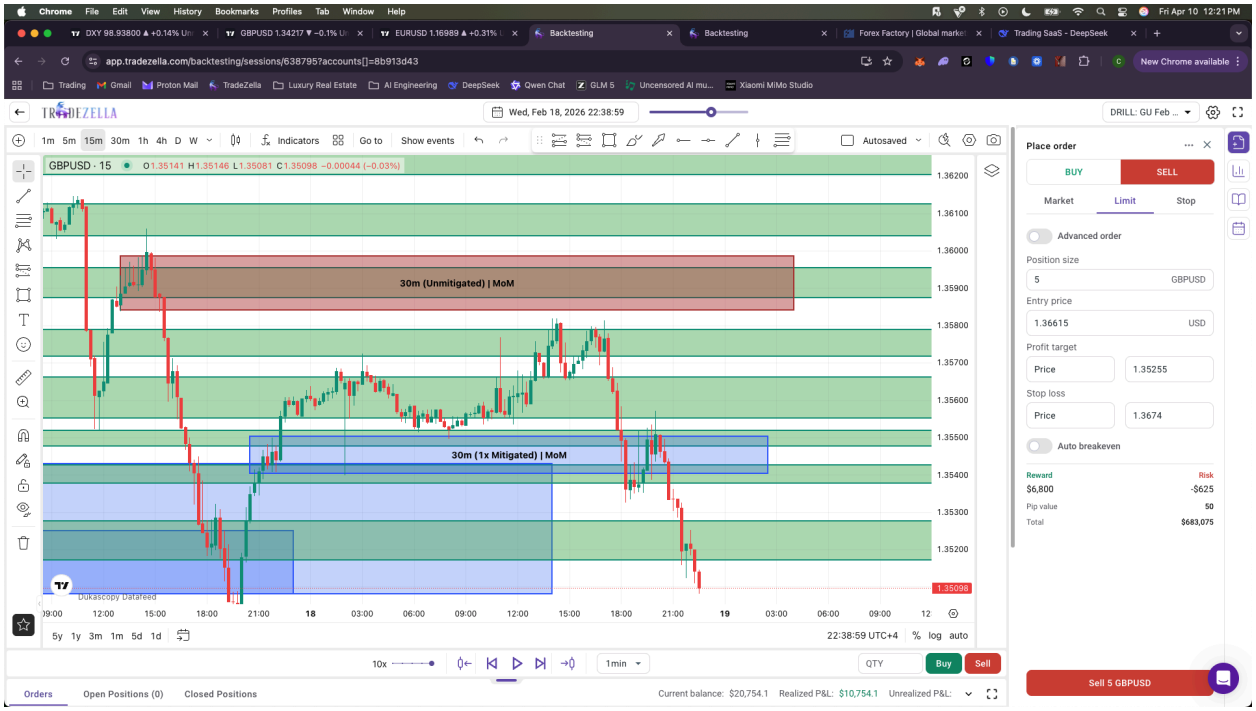

Whenever you think "where is it going to go? I don't know" - **what is the bias, direction, and pressure flow of the 4H storyline? There is your answer**

Remember that on GU price can often react from the "Liquidity Shield" of a S/D zone (the liquidity zone right in front of a S/D zone)

EURUSD is where PA often directly touches the overlap point.

GBPUSD can use liquidity shields to protect UM zones while still exerting pressure.

Remember this.

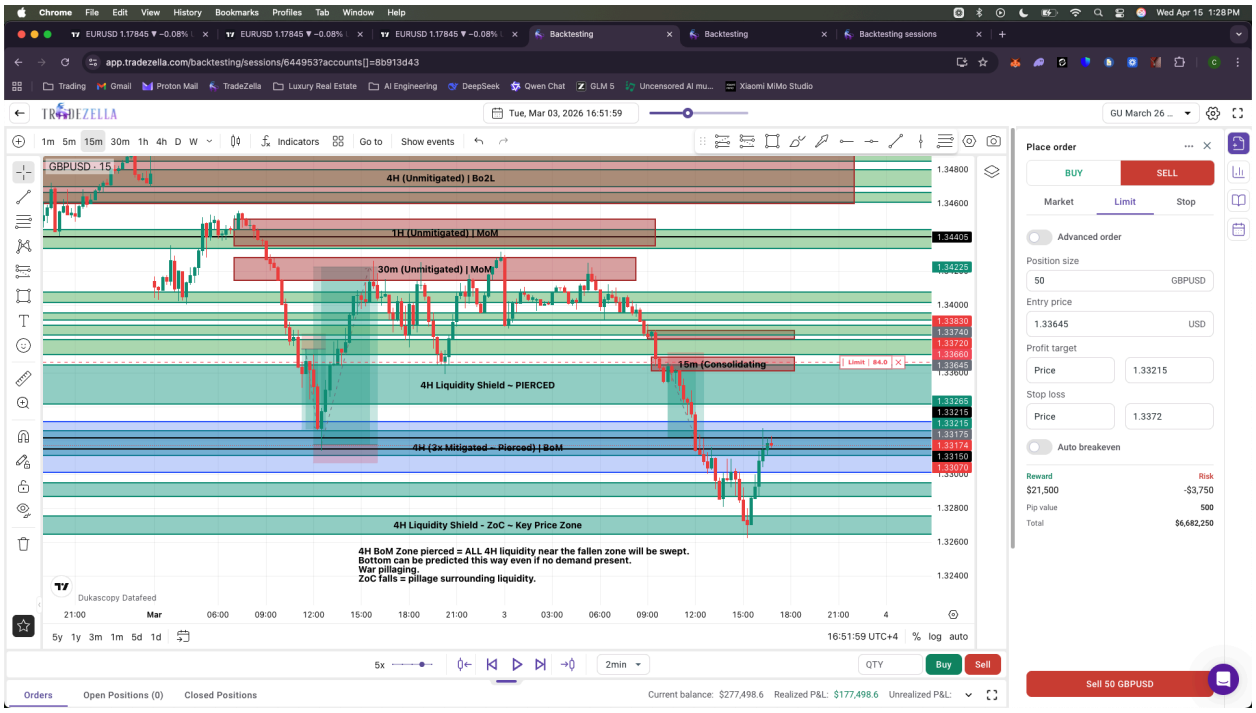

You should mostly IGNORE MoM zones for entries.

ONLY take entries on BoM zones.

90% more likely to catch a winning trade.

MoM zones are for OPPOSING LIQUIDITY to set <u>TP Zones.</u>

Especially if trading against the HTF trend (catching the 4H buy correction in a Bearish Bias)

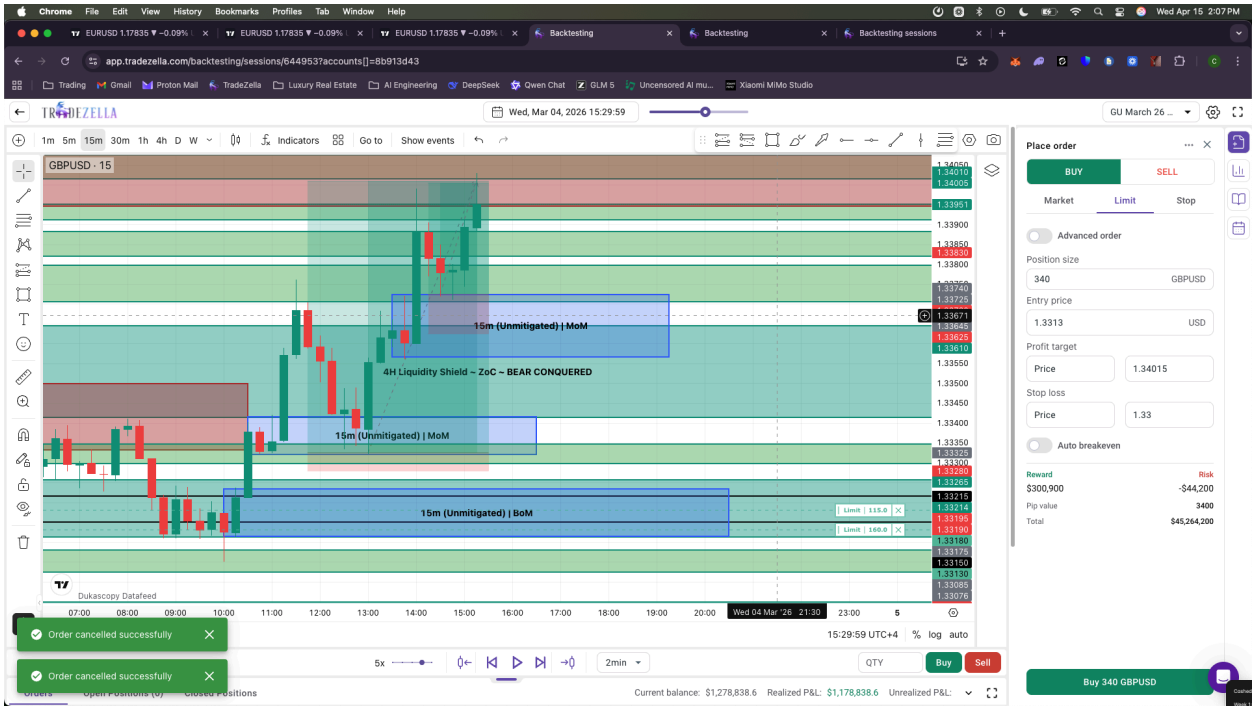

MoM zones can be used as <u>ladder method entry points</u> when <u>obviously</u> aligned with the trend.

Liquidity zones are the anchor points for ladder steps. Align them with the S/D.

S/D give liquidity juice.

<u>Liquidity gives Earth Density.</u>

Don’t enter on anything other than Earth Density. It will lose money.
